

Supplementary Materials

Comparison of the Transcriptomic Signatures in Pediatric and Adult CML

Minyoung Youn, Stephanie M. Smith, Alex Gia Lee, Hee-Don Chae, Elizabeth Spiteri, Jason Erdmann, Ilana Galperin, Lara Murphy Jones, Michele Donato, Parveen Abidi, Henrique Bittencourt, Norman Lacayo, Gary Dahl, Catherine Aftandilian, Kara L. Davis, Jairo A. Matthews, Steven M. Kornblau, Min Huang, Nathan Sumarsono, Michele S. Redell, Cecilia H. Fu, I-Ming Chen, Todd A. Alonzo, Elizabeth Eklund, Jason Gotlib, Purvesh Khatri, E. Alejandro Sweet-Cordero, Nobuko Hijiya, and Kathleen M. Sakamoto

Methods S1:

FISH

CML CD34+ cells were isolated by magnetic sorting (Miltenyi Biotec, Inc.: Sunnyvale, CA, USA). Sorted cells underwent hypotonic cell expansion and methanol/acetic acid fixation. Slides were prepared, pretreated with 2xSSC, alcohol dehydrated, and hybridized with BCR-ABL t(9;22) dual color, dual fusion translocation probes (Abbott/Vysis). Analysis of 200 interphase nuclei per slide was performed by a fluorescent microscope. Observed signal patterns were tallied and categorized, as per clinical standards.

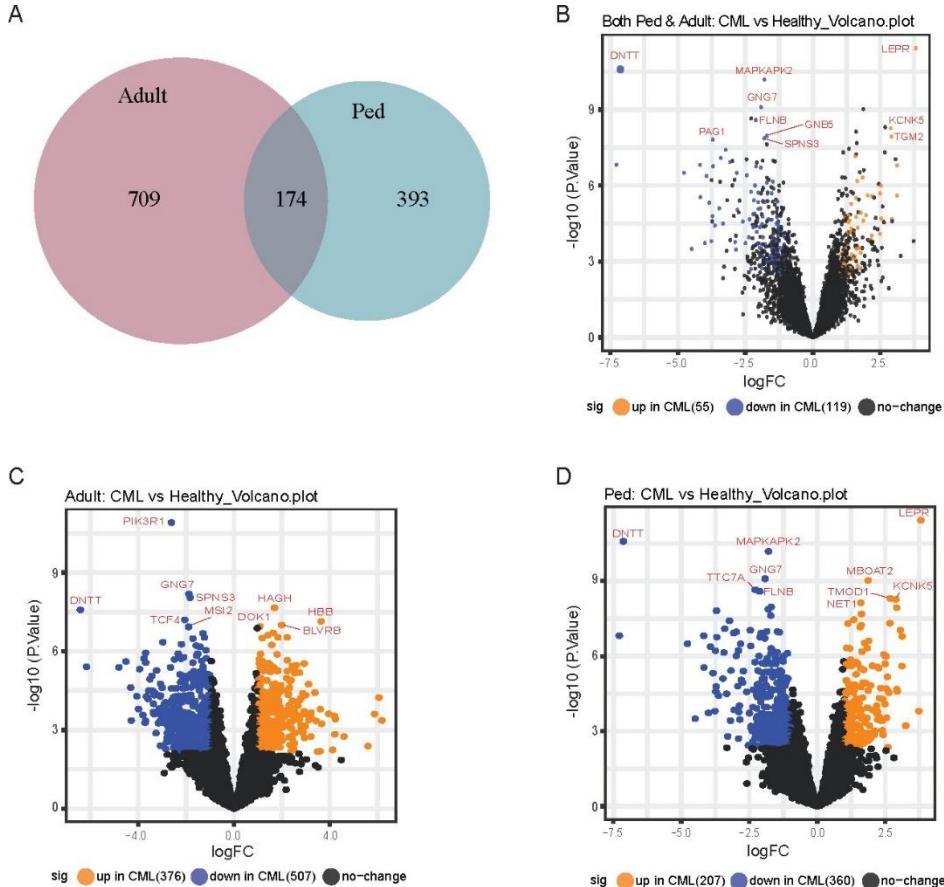

Figure S1. Volcano plots show differentially expressed genes in each comparison. (A) Venn diagram with the number of differentially expressed genes (DEG) between CML CD34+ cells and healthy

control CD34+ cells in each age group. DEG defined as FDR of ≤ 0.05 and absolute log₂ fold-change > 1 . (B) Volcano plot with commonly regulated genes in both pediatric and adult CML CD34+ cells. (C) Volcano plot with DEG comparing adult CML CD34+ cells vs. adult healthy control CD34+ cells. (D) Volcano plot with DEG comparing pediatric CML CD34+ cells vs. pediatric healthy control CD34+ cells.

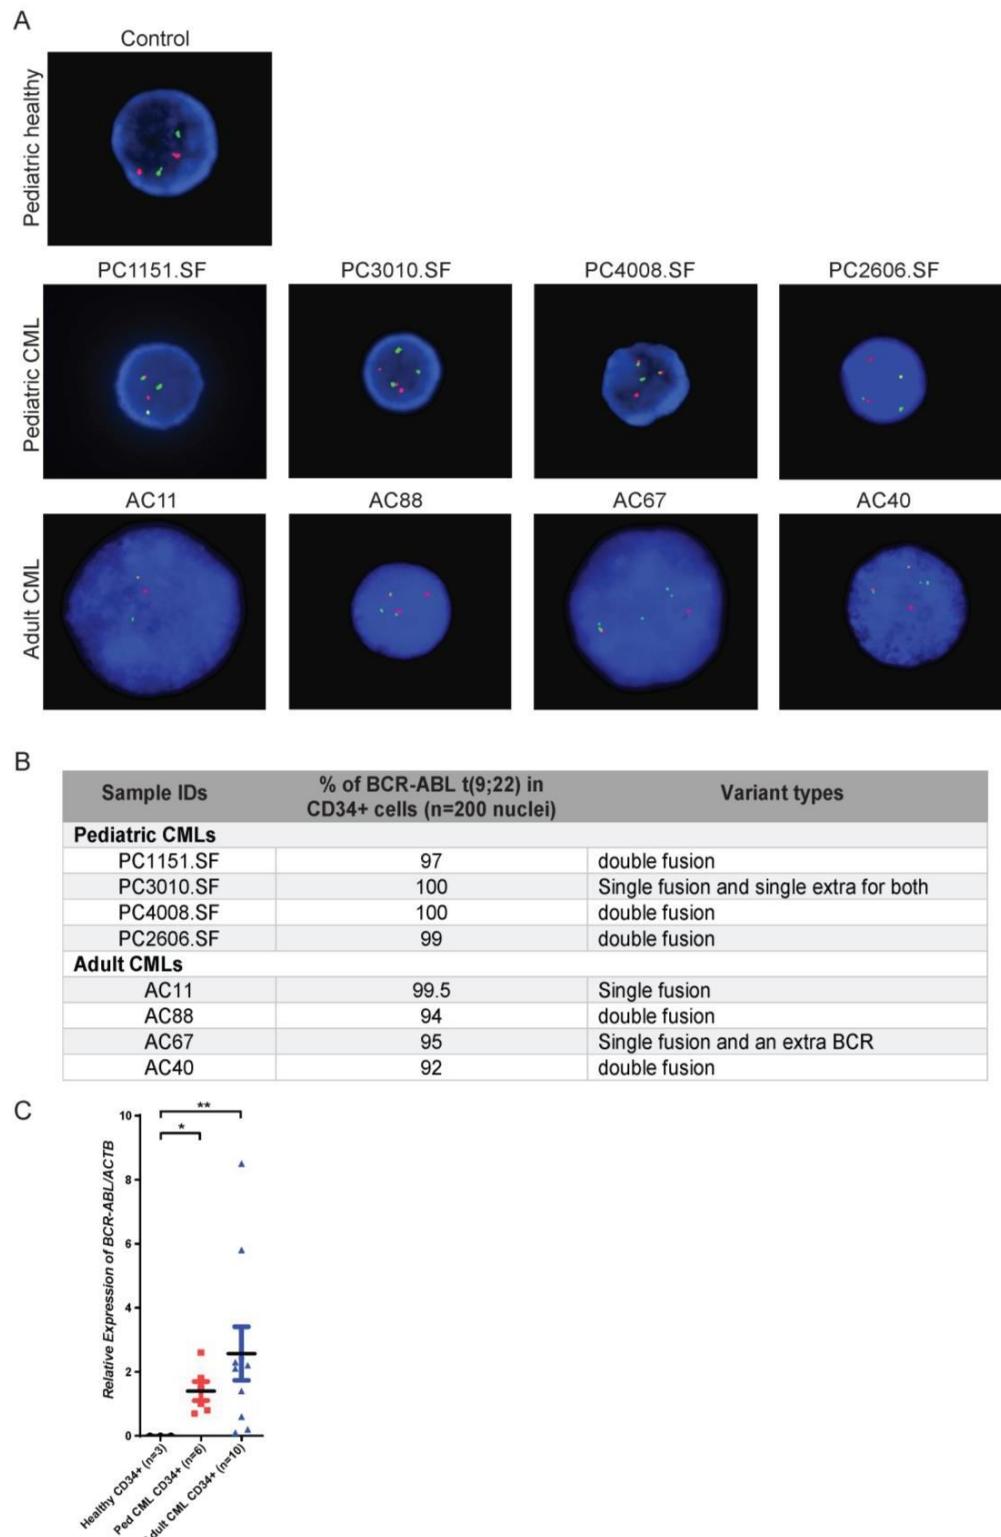

Figure S2. BCR-ABL1 fusions were detected in $\geq 92\%$ of CD34+ cells from both pediatric and adult CML patient samples by FISH analysis. * Green: BCR, Red: ABL1. (A) Representative images of

BCR-ABL+ cells in indicated samples. (B) Percentages of BCR-ABL+ cells in each CML CD34+ sample. (C) BCR-ABL expression was detected by RT-qPCR in CD34+ cells from pediatric and adult patients with CML but not in CD34+ cells from healthy donors.

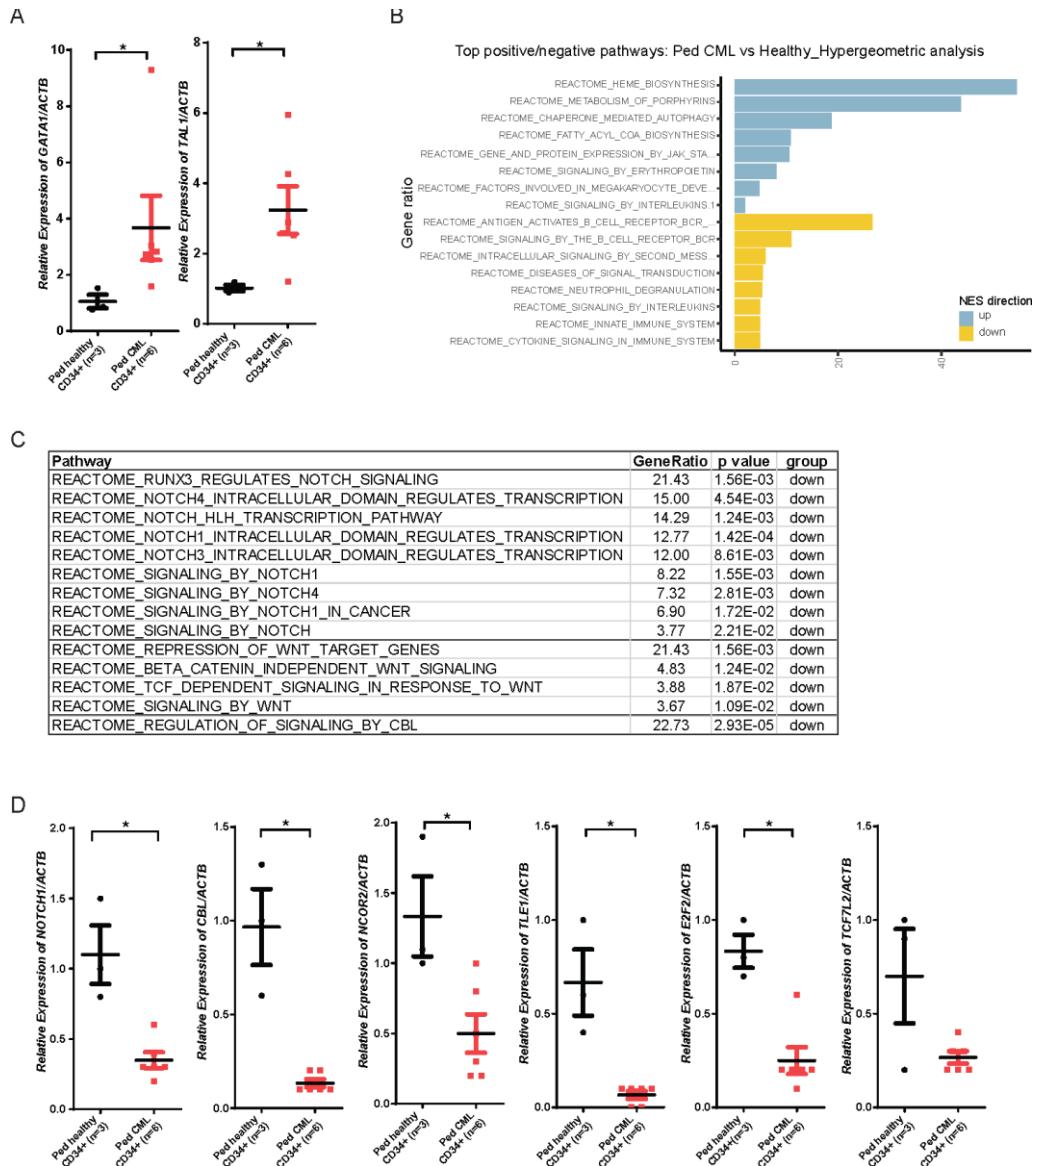

Figure S3. Differentially expressed genes and pathways comparing pediatric CML CD34+ cells vs. pediatric healthy control CD34+ cells. (A) GATA1 and TAL1 expression were significantly increased in pediatric CML CD34+ cells compared to pediatric healthy CD34+ cells. (B) Barplot shows top REACTOME pathways in pediatric CML. CD34+ cells compared to pediatric healthy CD34+ cells. (C) NOTCH, WNT, and CBL pathways were significantly downregulated in pediatric CML compared to pediatric healthy controls. (D) Several genes involved in NOTCH, WNT, and CBL pathways demonstrate decreased expressions in pediatric CML CD34+ cells compared to pediatric healthy CD34+ cells. Each spot on the graph represents an individual sample. mRNA levels were assessed by RT-qPCR and normalized against *beta-actin* (*ACTB*) expression. * $p < 0.05$.

B

Ped Healthy vs Adult Healthy_Volcano.plot

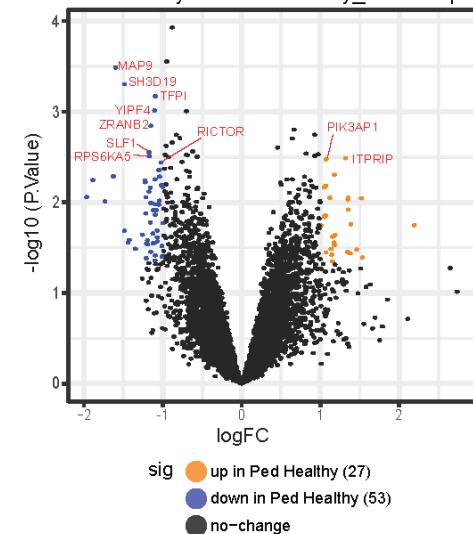

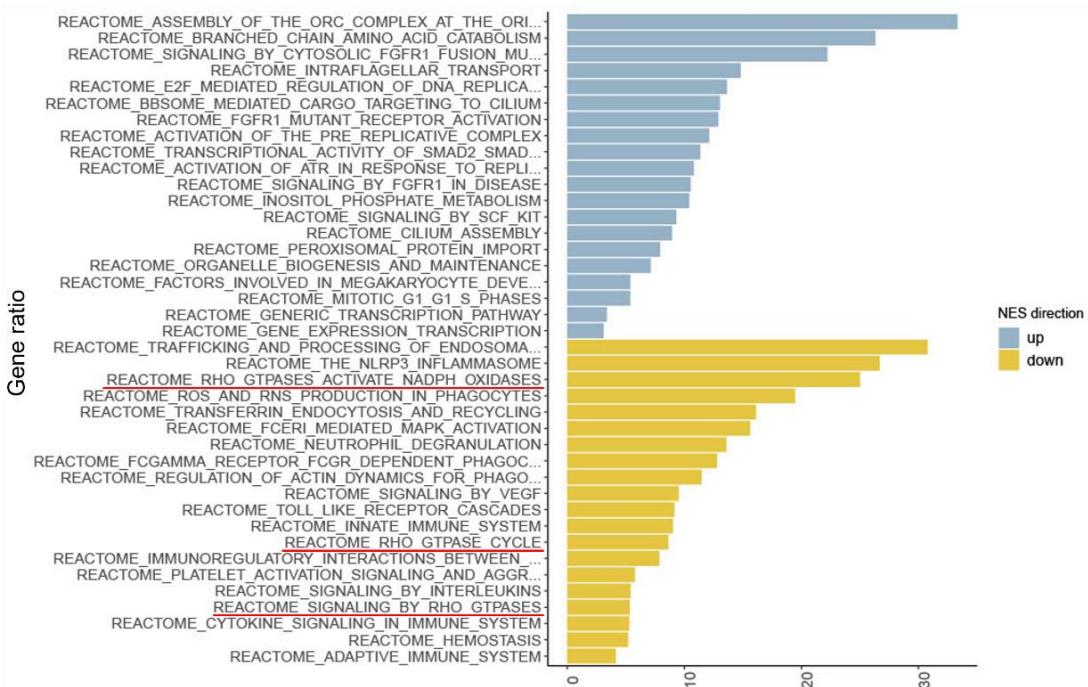

Figure S4. Comparison of pediatric healthy and adult healthy CD34+ cells does not show significant differences. (A) Table and (B) Volcano plot show DEG in pediatric and adult healthy controls. DEG defined as FDR of ≤ 0.8 and absolute log2 fold-change > 1 .

A

Top positive/negative pathways: (Ped CML vs Ped healthy) vs (adult CML vs adult healthy)_Hypergeometric analysis

**B**

Rho specific pathways: (Ped CML vs Ped healthy) vs (adult CML vs adult healthy)_Hypergeometric analysis

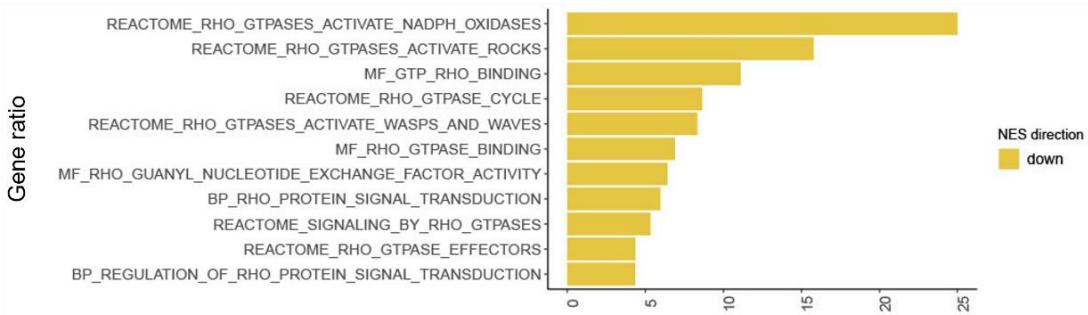

Figure S5. Differentially expressed pathways for (pediatric CML vs pediatric healthy) vs (adult CML vs adult healthy). **(A)** top REACTOME pathways **(B)** Rho pathways only; MF and BP are GP terms for Molecular Function and Biological Process, respectively.

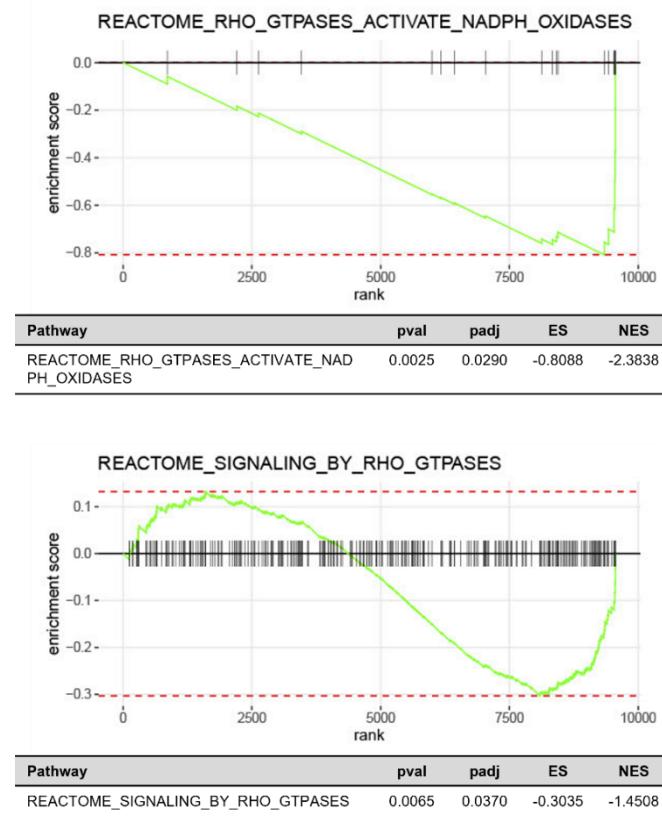

Figure S6. GSEA-enrichment plots of Rho pathways between (pediatric CML vs pediatric healthy) vs (adult CML vs adult healthy).

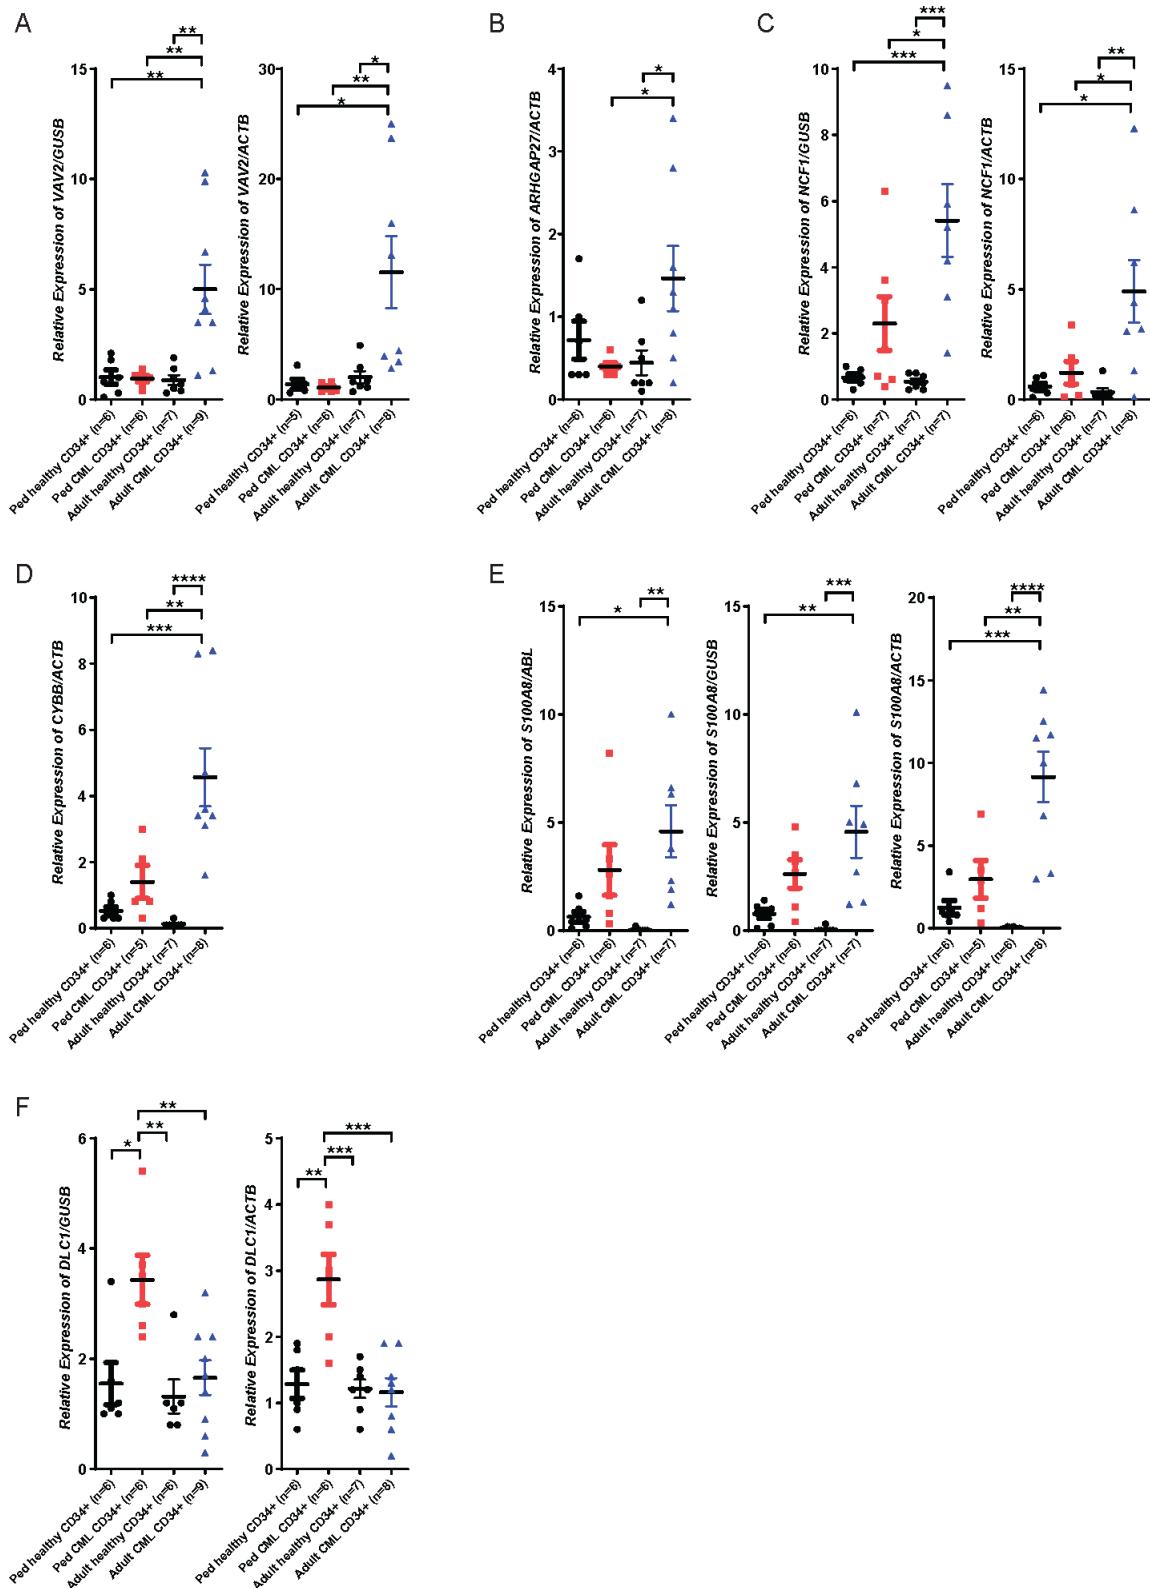

Figure S7. Several genes involved in the Rho pathway were differentially expressed between pediatric CML CD34+ cells and adult CML CD34+ cells. (A-F) mRNA expression levels of dysregulated genes were assessed by RT-qPCT and normalized against *Abelson (ABL)*, *beta-glucuronidase (GUSB)*, or *beta-actin (ACTB)* expression. Data were graphed as mean \pm SEM. Each spot on the graph represents an individual sample. *p* values for statistical significance were obtained using unpaired Student t-test or ANOVA test (Tukey's multiple comparison). * *p* < 0.05, ** *p* < 0.01, *** *p* < 0.001, **** *p* < 0.0001.

Table S1. Demographic and clinical characteristics of CML patients and healthy controls.

Table S4. All DEG in comparison of (pediatric CML vs pediatric healthy) vs (adult CML vs adult healthy), sorted according to logFC level. *p* values were obtained using hypergeometric test. In red are genes that we validated by RT-qPCR.

Upregulated in Pediatric CML Compared to Adult CML				Downregulated in Pediatric CML Compared to Adult CML			
Gene	logFC	<i>p</i> .Value	adj. <i>p</i> .Val	Gene	logFC	<i>p</i> .Value	adj. <i>p</i> .Val
