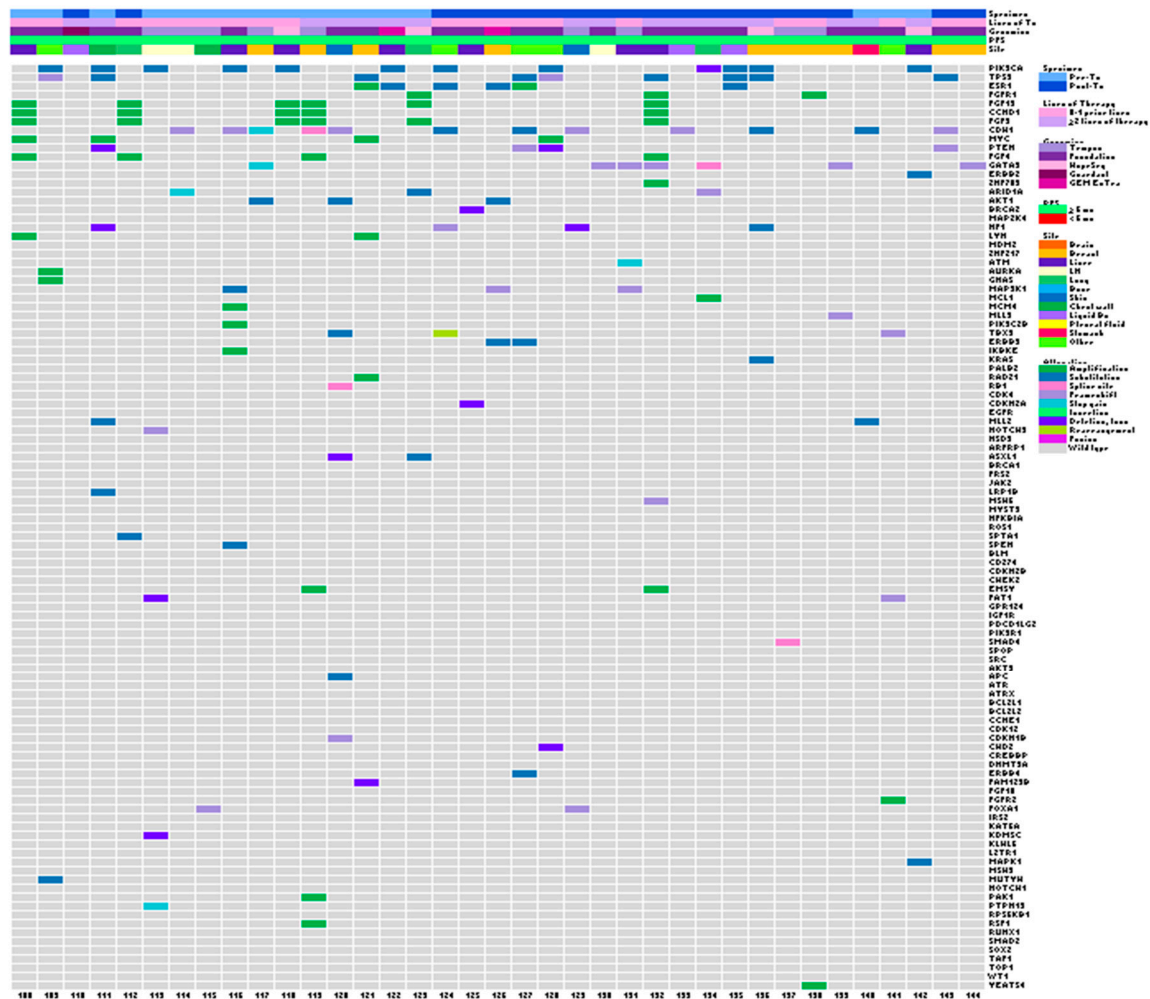

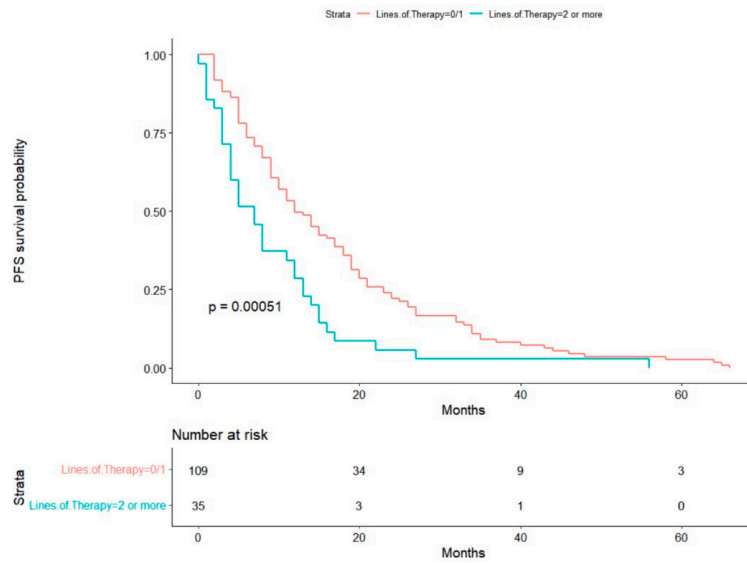

Figure S1. Tile plots of genomic alterations of each patient's tumor specimen: A) early progression (PFS < 6 months; N=41); B) intermediate progression (PFS 6-24 months for 0-1 lines; 6-9 months for 2+ lines; N=66); C) late progression (PFS >24 months for 0-1 lines; PFS >9 months for 2+ lines; N=37).

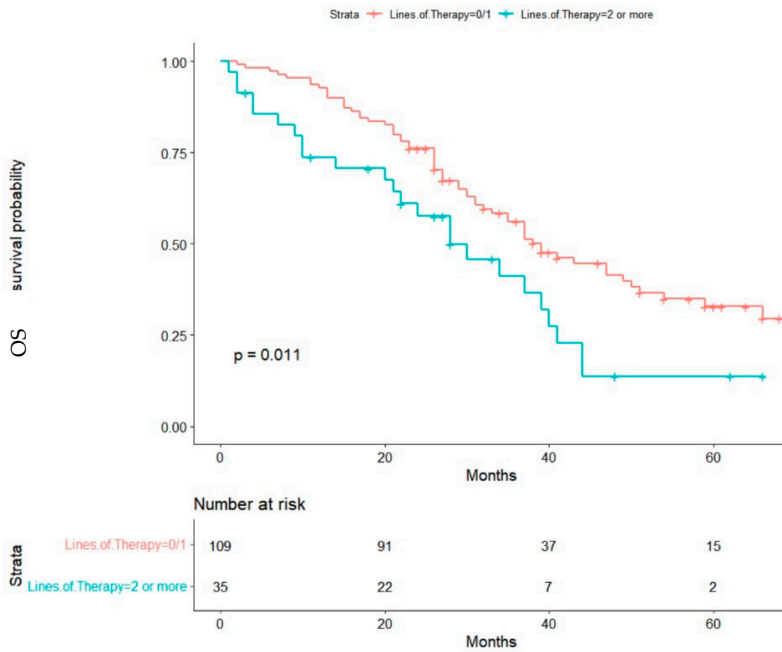

Figure S2. Kaplan-Meier survival analysis stratified by prior lines of chemotherapy: A) Median PFS for 0-1 prior lines (N=109) was 12 months (95% CI 10, 17) and for ≥ 2 lines (N=35) was 7 months (95% CI 4, 12); B) Median OS for 0-1 prior lines (N=109) was 39 months (95% CI 33, 51) and for ≥ 2 lines (N=35) was 28 months (95% CI 21, 41). Date of last follow up was used.

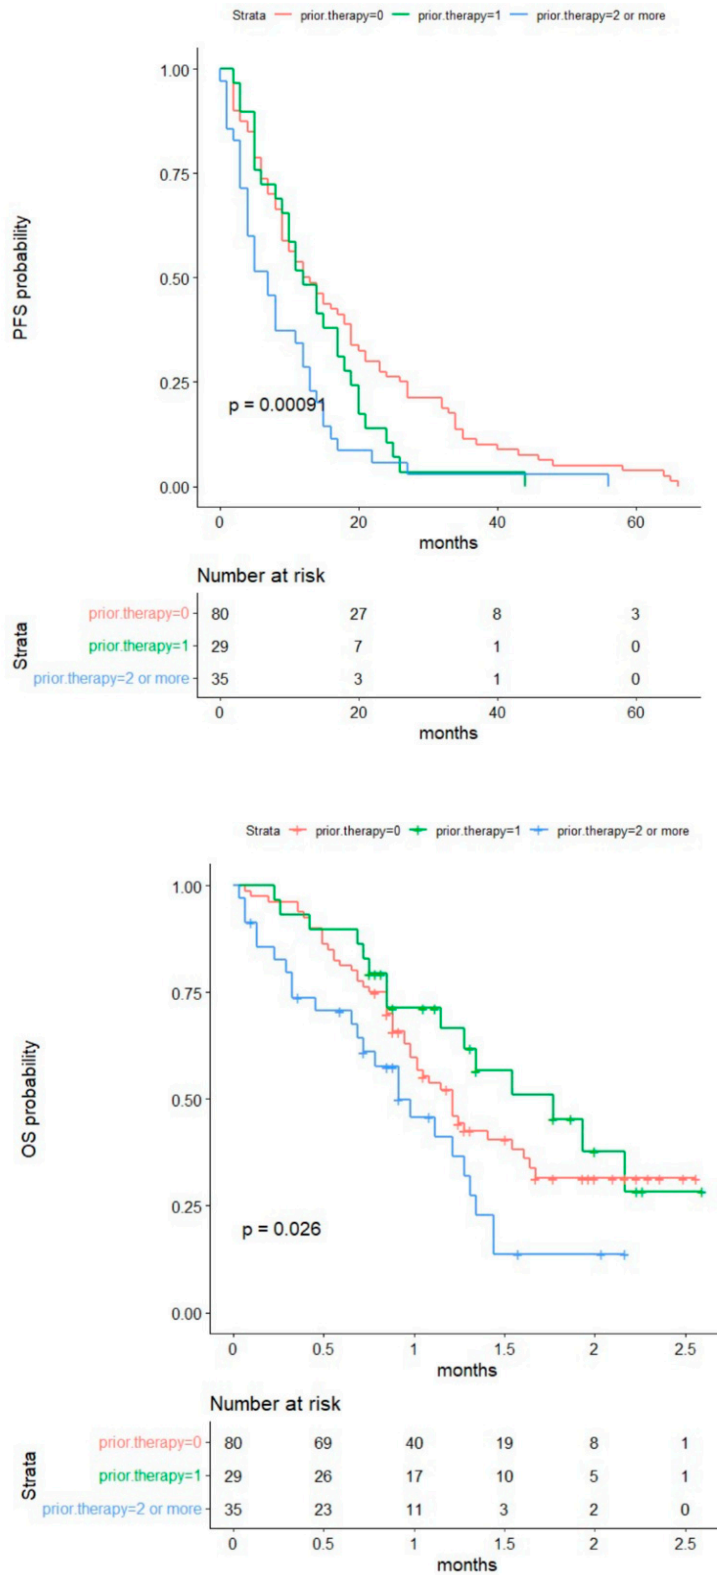

Figure S3. Kaplan-Meier survival analysis stratified by 0, 1, and ≥ 2 prior lines of chemotherapy: A) Median PFS for 0 prior lines (N=80, red line) was 12.5 months (95% CI 9–19); median PFS for 1 prior line (N=29, green line) was 12 months (95% CI 12–18); and median PFS for ≥ 2 lines (N=35, blue line) was 7 months (95% CI 4–12); B) Median OS for 0 prior lines (N=80, red line) was 37 months (95% CI 30–50); median PFS for 1 prior line (N=29, green line) was 54 months (95% CI 29–NA); and median PFS for ≥ 2 lines (N=35) was 28 months (95% CI 21–41).

Table S1. Tumor genomic analysis of patients with 0 or 1 line of prior therapy (n=109) and mutations that are present in ≥ 2 patients showed association with impaired PFS.

Table S2. RNA analysis for patients with 0 or 1 line of prior therapy (n=24) patients with 0-1 prior lines of therapy. 11,426 protein-coding genes were studied, and FDR was calculated to adjust for multiple comparisons. The 56 genes in the heatmap were selected with $HR > 4$ or < 0.25 with $FDR < 0.15$. Unsupervised hierarchical clustering showed 3 clusters with distinct gene expression pattern. The 3 clusters are characterized by early, intermediate, and late PFS with the median PFS of 4.5 (n=4 range), 8.5 (n=12 range) and 29 (n=8, range) months, respectively. Statistical analysis was conducted in R (R-3.6.3, R Core Team).
