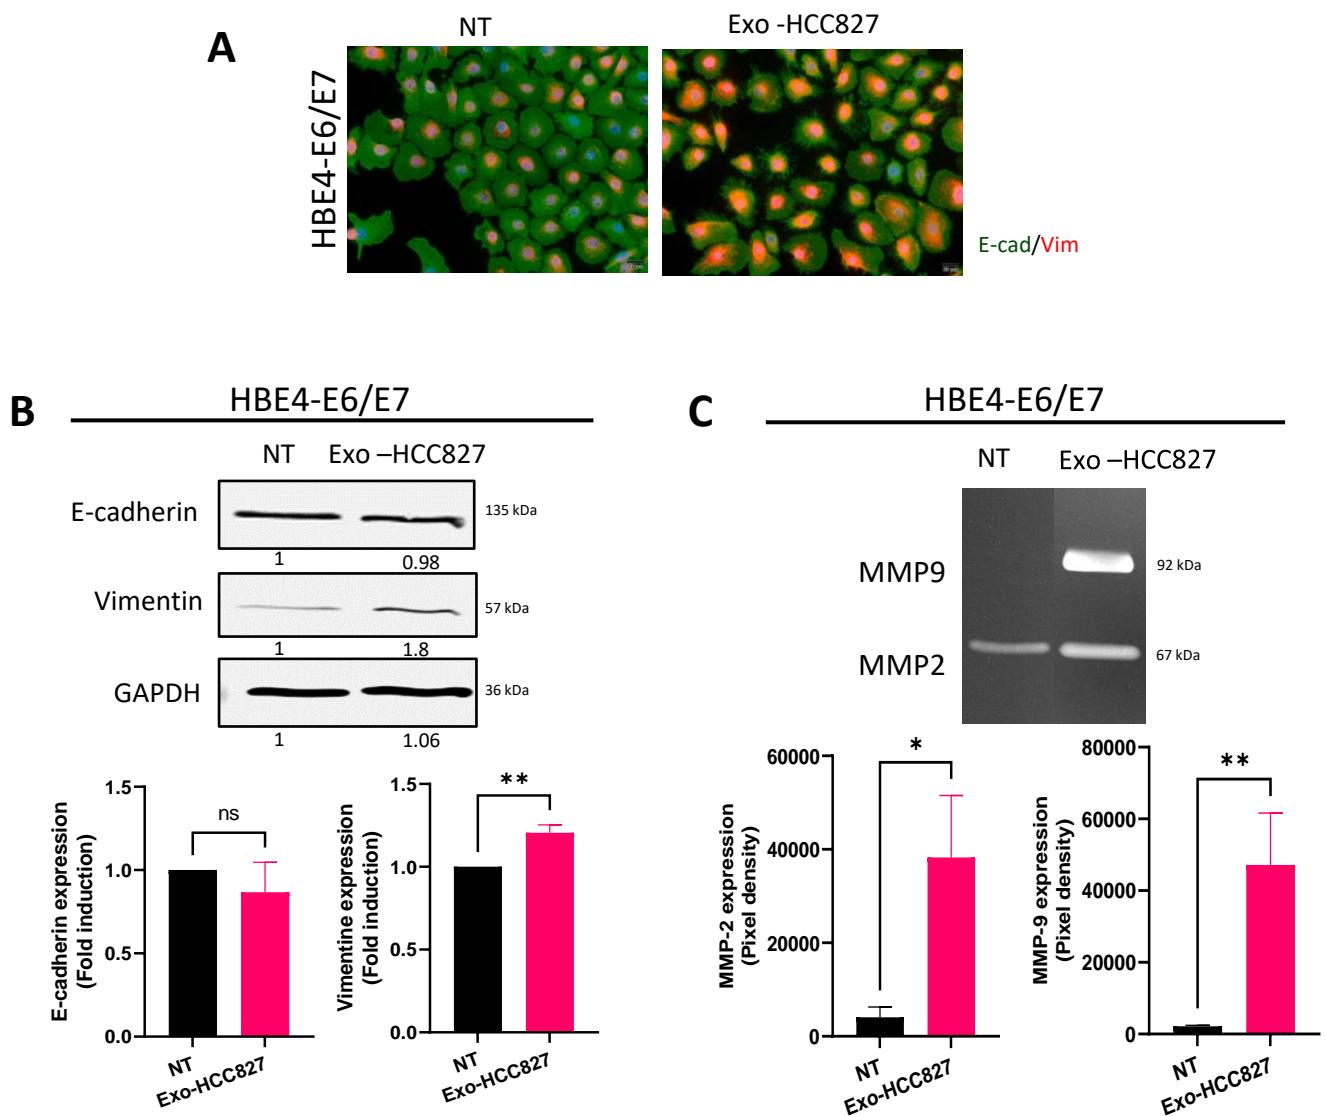

Figure S4: Exosomes derived from HCC827 cell line promote extracellular matrix degradation and EMT **A)** Immunofluorescence detection of Vimentin (red) and E-cadherin (green) in HBE4 E6/E7 cells treated with exosomes isolated from HCC827 supernatant. Nuclei were stained with DAPI (blue). Scale bar = 20  $\mu$ m. **B)** Western blot analysis and quantification of Vimentin and E-cadherin expression in HBE4 E6/E7 cells treated with exosomes isolated from HCC827 supernatant. GAPDH is used as a loading control. **C)** Zymography analysis and quantification of HBE4 E6/E7 cells treated with exosomes isolated from HCC827 supernatant.

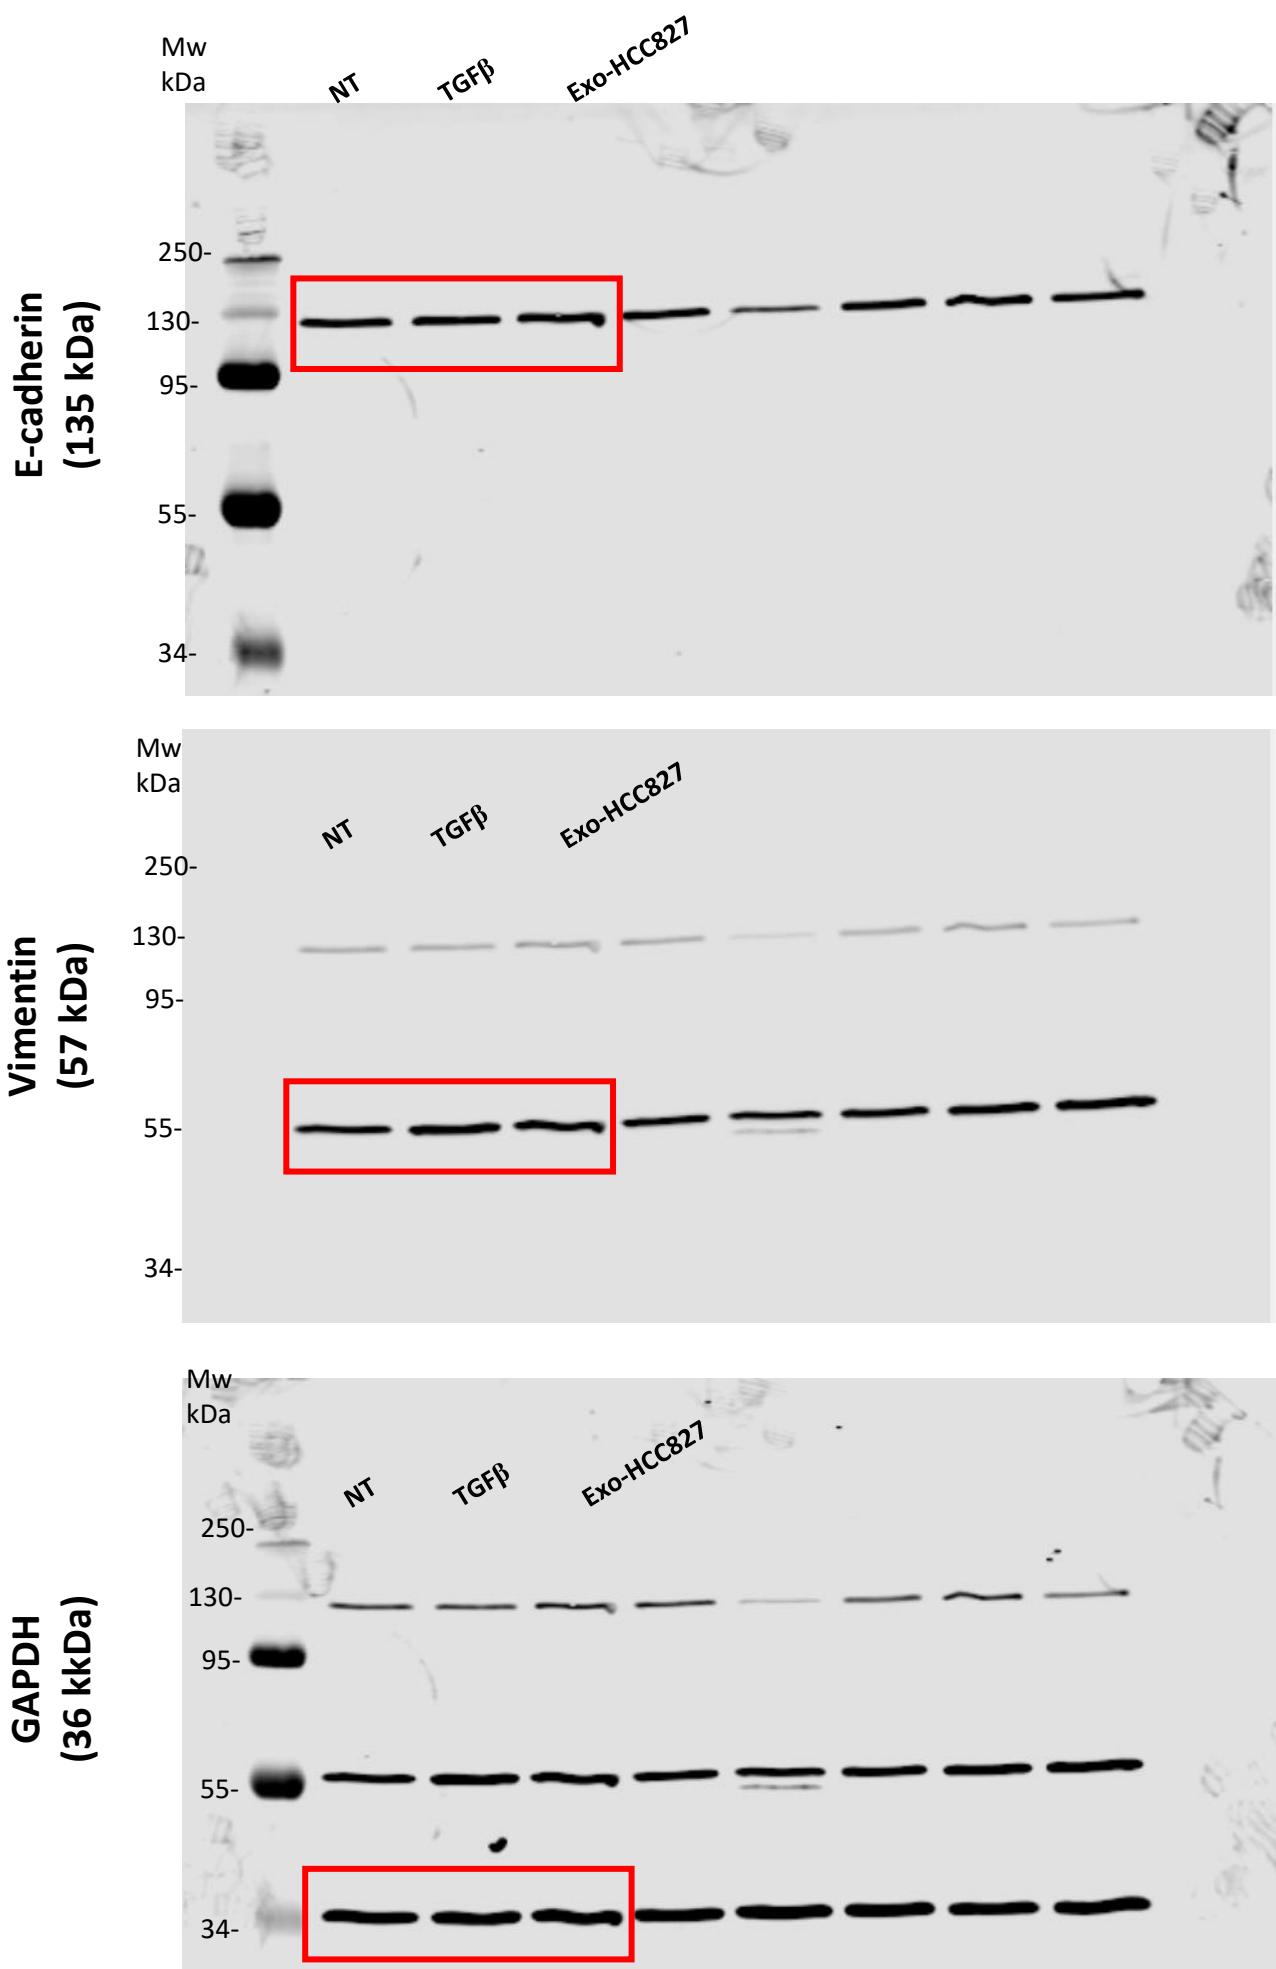

Figure S5: Original whole Western-blots Images for Supplementary Figure 4. The densitometry reading for the western-blots could be found in supplementary Table 5.

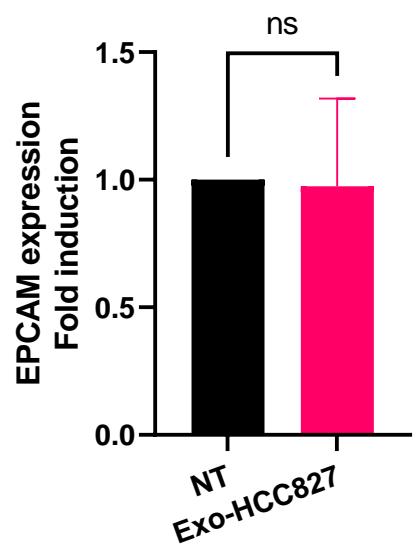

Figure S6: Exosomes from HCC827 cell line don't alter tight junction expression. Quantification analysis of EPCAM expression obtain by RT-qPCR of protein extracts of A549 cells treated with exosomes isolated from HCC827 supernatant.
