

Data-extraction tables

Table S2. Data-extraction table of quantitative studies.

Author	Study design	Psychosocial outcomes	Recruitment	Patients	Sample size	Mean age (years)	Female sex (%)	Time since diagnosis	Baseline results (mean (SD))	Terminology to refer to patient group
Adamowicz, 2018, Poland	Prospective cohort study	Health-related Quality of Life	Consecutive sampling; recruitment from the Specialist Hospital and the Regional Center of Oncology in Poland	Colorectal cancer; first-line palliative chemotherapy	330	66.0 (SD=11.7, range: 36-88)	57.9	NR	<i>EORTC-QLQ-C30</i> Pre-treatment: QL: 65 (16.5) EF: 71 (15.6) Post-treatment: QL: 68 (15.4) EF: 72 (14.8)	Metastatic colorectal cancer patients; patients with advanced disease
Bannink, 2008, The Netherlands	Longitudinal survey study	Depression; anxiety	Part of the patients were recruited via the intervention arms of larger RCTs (EORTC 19881; EORTC 30012); recruitment of other patients not further specified	High-risk melanoma (n=8) or disseminated renal-cell carcinoma (n=35); interferon-alpha treatment	43	Median age: 58.0 (range: 36-72)	58.2	NR	<i>MADRS</i> <i>Total</i> 3.9 (3.8) <i>BAS Irritability</i> 0.4 (0.7) <i>HADS-A</i> 4.6 (3.0) <i>HADS-D</i> 2.6 (2.2) <i>BDI sum score</i> 5.6 (4.1) <i>SCL-90 Total</i> 112.6 (16.9)	Disseminated renal cell carcinoma
Benedict, 2014, USA	Cross-sectional preliminary analysis of baseline data from a larger randomized controlled trial	Psychosocial wellbeing; Quality of Life	Patients were part of a larger RCT; recruitment via referrals from urology clinics, community presentations, and through the Florida Cancer Data System	Prostate cancer; luteinizing hormone-releasing hormone agonists with concomitant external beam radiation therapy (EBRT)	80	69.7 (SD=9.6)	0.0	37.6 months (SD: 34.3)	<i>FACT-G</i> <i>QL</i> : 82.7 (14.4) <i>CES-D</i> 9.3 (9.5)	Patients with advanced prostate cancer undergoing androgen deprivation therapy
Bergerot, 2019, USA	Cross-sectional survey study	Quality of Life; anxiety; depression	Recruitment via one of three genitourinary medical oncologists at the institution	Metastatic renal cell carcinoma (63%), urothelial cancer (28%) and prostate cancer (8%); immunotherapy (checkpoint inhibitors (CPIs)): nivolumab (35%) and atezolizumab	60	65.0 (SD=13, rang: 31-91)	32.0	NR	<i>FACT-G PROMIS-Depression</i> <i>PROMIS-Anxiety</i> baseline scores NR	Patients with advanced genitourinary cancers initiating immunotherapy; patients with metastatic genitourinary cancer

				(30%), administered as first (33%) or second line of therapy (45%) for the majority of patients						
Carmichael, 2013, USA	Cross-sectional survey study	Health-related Quality of Life	Purposive sampling; all patients diagnosed with RCC were identified using a institutional database	Metastatic renal cell carcinoma; targeted therapy (VEGF- or mTOR-directed therapy)	28	58.0 (rang: 40-72)	250	NR	<i>EORTC-QLQ-C30</i> QL 73.5 (21.0) EF 82.4 (14.6)	Long-term survivors (with metastatic renal cell carcinoma)
Cohen, 2001, USA	Secondary analysis of data from a phase Ib trial	Treatment-specific optimism; depression; mood disturbance; distress	Patients were enrolled in a phase Ib trial of a heat shock protein peptide complex 96 trial	Metastatic renal cell carcinoma (n=24), metastatic melanoma (n=22); nontoxic, active, specific immunotherapy comprised of an autologous tumor preparation without adjuvant therapy	46	54.9 (SD=8.9, range: 36-76)	30.0	Mean TSD: 23.2 months (SD: 37.1, range: 1-168)	<i>CES-D</i> 12.67 (9.78) <i>POMS</i> TMD: 23.50 (33.71) <i>POMS</i> Depression 8.33 (10.36) <i>BSI</i> GSI 0.46 (0.40) Depression 0.48 (0.68)	Patients with metastatic renal cell carcinoma/metastatic melanoma
Cohen (de Moor), 2002, USA	Prospective observational study of data from a phase Ib trial	Quality of Life	Patients were enrolled in a phase Ib trial of a heat shock protein peptide complex 96 trial	Stage IV metastatic renal cell carcinoma; heat-shock protein peptide complex 96 (HSPPC-96) autologous tumor vaccine treatment, a nontoxic, active, specific immunotherapy	29	56.5 (SD=8.4, range: 37-76)	22.0	NR	<i>SF-36</i> GH: 62 (22); Role limitations: emotional: 76 (38) <i>IES</i> 21 (17)	Patients with metastatic renal cell carcinoma
Cohen (Parker), 2002, USA	Prospective observational study of data from a phase Ib trial	Quality of Life	Patients were enrolled in a phase Ib trial of a heat shock protein peptide complex 96 trial.	Advanced melanoma stage III (n=10) or stage IV (n=20); heat-shock protein peptide complex 96 (HSPPC-96) autologous tumor vaccine treatment, a nontoxic, active, specific immunotherapy	30	50.1 (SD=11.1)	37.0	NR	<i>SF-36</i> GH: 59 (21); Role limitations: emotional: 91 (32) <i>IES</i> 23 (15)	Patients with advanced melanoma
Custers, 2015, The Netherlands	Cross-sectional survey study	Fear of cancer recurrence; fear of progression	Recruitment from the database in Radboud University Medical Centre	Gastrointestinal stromal tumors: localized (50%) or metastatic (50%); the tyrosine kinase inhibitor imatinib	54	Median age: 63.0 (range: 21-83)	46.0	Mean TSD: 3.9 years (range: 0.5-17)	<i>FCRI Severity</i> 16.8 (7.7) <i>CWS</i> 14.46 (5.2) <i>EORTC-QLQ-C30</i> QL 77.2 (19.8) EF 78.4 (25.4)	Patients with metastatic GIST

									<i>HADS 9.3 (7.8)</i> <i>IES 15.1 (16.7)</i>	
Daugherty, 2005, USA	Cross-sectional survey study	Spirituality; Quality of Life	Recruitment from the population of advanced cancer patients who had been accepted for phase I trials at a large urban, Midwestern medical center in the USA	Advanced cancer patients; experimental agents in clinical phase I trials (n=162) or standard care (n=156)	318	57.8 (SD=12.6) versus 57.9 (SD=12.3) for patients in phase I trials versus standard care respectively	45 versus 58	NR	<i>FACIT-SP 40.7 (7.2) versus 39.7 (7.2)</i> <i>FACT-G QL 90.1 (13.6) versus 87.4 (14.5)</i> <i>EW 15.6 (3.7) versus 16.2 (3.7) for patients in phase I trials versus standard care respectively</i>	Advanced cancer patients; terminally ill cancer patients;
Denouel, 2018, France	Longitudinal survey study	Quality of Life	Patients were enrolled in the COG-ANGIO study in 3 French institutions	Metastatic renal cell carcinoma; antiangiogenic therapies (vascular endothelial growth factor or mTOR inhibitors)	39	Median age: 59.0 (28-78)	26.0	NR	<i>FACT-G QL 81.2</i> <i>EW 18.2 (3.5) (11.0)</i>	Metastatic renal cell carcinoma patients
Devine, 2003, USA	Longitudinal survey study	Quality of Life; psychological distress; social support; intrusive thoughts; avoidance	Patients were enrolled in a clinical trial receiving an experimental vaccine (Phase 1/b)	Metastatic renal cell carcinoma (n=29) and metastatic melanoma (n=24); non-toxic, active, specific immunotherapy, consisting of an autologous tumor preparation	53	53.4 years (range: 31-76)	26.0	NR	<i>IES 19.8 (14.5)</i> <i>BSI GSI 0.39 (0.32)</i>	Patients with metastatic renal cell carcinoma; metastatic melanoma (Stage III or IV)
Greer, 2019, USA	Randomized clinical trial	Anxiety; depression; Quality of Life	Eligible patients were invited to participate in the study	Gastrointestinal cancer (24.7%), gynaecological cancer (19.2%), lung cancer (20.5%), breast cancer (11.0%), melanoma (6.8%), sarcoma (9.6%), genitourinary (6.8%), thyroid (1.4%); CBT group: intravenous chemotherapy (82.2%), oral chemotherapy	145 (72 CBT group, 73 control group)	56.5 (SD=11.3)	73.8	Median TSD: CBT group: 7.7 (range: 1.9- 23.3), control group: 7.5 (range: 2.0 - 24.3)	<i>HAM-A 19.4 (9.0) versus 19.1 (7.6)</i> <i>HADS-A 11.2 (2.4) versus 11.6 (3.0)</i> <i>HADS-D 6.8 (3.1) versus 7.0 (3.4)</i> <i>PHQ-9 9.2 (5.1) versus 9.3 (5.1)</i> <i>FACT-G 66.4 (12.3) versus 64.8 (16.3) for control versus CBT group</i>	Patients with incurable cancer

				(5.5%), immunotherapy (13.7%), radiation (6.8%), surgery (6.8%); control group: intravenous chemotherapy (80.6%), oral chemotherapy (4.2%), immunotherapy (11.1%), radiation (6.9%), surgery (9.7%)						
Greer, 2012, USA	Pilot randomized controlled trial	Anxiety; Quality of Life	Recruitment via oncology clinicians, palliative care specialists, psychiatrists, or patients themselves through advertisements in the Massachusetts General Hospital (MGH) Cancer Center in Boston	Metastatic lung cancer (30.0%), metastatic pancreatic cancer (17.5%), metastatic colorectal cancers (15.0%), others (37.5%); CBT group (n=20): chemotherapy (80%), radiation (5%), ambulatory palliative care (35%), control group (n=20): chemotherapy (100%), radiation (10%), palliative care (30%)	40 (40 CBT group, 40 control group)	55.9 (SD=10.9, range: 31-81)	70.0	Median TSD: CBT group: 6.6 months (range: 2.2-62.6), control group: 5.4 (range: 0.7-56.0)	<i>HAM-A</i> 24.5 (7.3) versus 24.4 (6.9) <i>MADRS</i> 23.4 (9.0) versus 22.4 (19.74) <i>HADS-A</i> 7.9 (4.5) versus 8.8 (4.6) <i>HADS-D</i> 7.7 (3.8) versus 9.1 (5.8) <i>IES</i> 32.3 (13.3) versus 36.1 (17.0) <i>FACT-G</i> 59.7 (14.4) versus 59.1 (16.9) <i>EW</i> 13.00 (5.1) versus 11.6 (5.5) for CBT group versus control group	Patients with terminal cancer
Guo, 2017, China	Longitudinal survey study	Depression	Recruitment via the Cancer Hospital of China Medical University, Liaoning Cancer Hospital & Institutes,	Metastatic breast cancer; chemotherapy	176	Median age: 49.5 (28-80)	100	NR	<i>Self-Rating Depression Scale (SDS)</i> major/medium depression risk 25.6%; minor depression symptoms 33.5%; not depressed 41.0%; no baseline SDS mean score for the total group reported	Patients with metastatic breast cancer
Gupta, 2014, USA, France, Germany, Italy, Spain	Cross-sectional survey study	Health-related Quality of Life; treatment satisfaction; family life	Convenience recruitment via panel recruiting, grassroots campaigns and newspaper advertising; patient support groups, physician referrals	Metastatic breast cancer; chemotherapy (n=191) or hormone therapy (n=169)	360	58.3 (SD=6.32)	100	Mean TSD: 4.5 years (SD: 5.0)	<i>FACT-G total</i> 56.4 (15.2) <i>EW</i> 12.0 (5.0) <i>FACT-B</i> 74.1 (19.2)	Metastatic breast cancer patients

Khalaf, 2019, Canada	Randomized controlled phase II trial	Health-related Quality of Life; depression symptoms	Recruitment not further specified	Metastatic castration-resistant prostate cancer; first-line treatment abiraterone and prednisone (n=101) or enzalutamide (n=101)	202	Median age: abiraterone plus prednisone arm: 72.9 (67.4-79.1); enzalutamide arm: 77.6 (69.1-83.4)	0.0	NR	<i>FACT-P</i> 116 (105.7-130.1) versus 114 (100.0-128.0) <i>PHQ-9</i> 2 (1-5) versus 4 (1-7) for the abiraterone group versus enzalutamide group	Patients with metastatic castration-resistant prostate cancer
Kissane, 2004, Australia	Cross-sectional survey study	Quality of Life; depression; anxiety; coping	Recruitment from oncology services in seven general metropolitan hospitals and a range of private practitioners	Metastatic breast cancer; chemotherapy (plus further hormonal therapy, chemotherapy or radiotherapy)	200	51.0 (SD=9)	100	52 months (SD: 41)	<i>EORTC-QLQ-C30</i> <i>HADS</i> NR <i>MAC</i> NR <i>MCMQ</i> NR	Patients with metastatic breast cancer
Lacey, 2019, Australia	Pre-post-test feasibility cohort study (pilot study)	Quality of Life; depression; anxiety	Recruitment via referral by treating oncologists or nurses from a single institution. Control group includes individuals who were eligible for the study but declined the supportive care intervention (Metastatic melanoma; immunotherapy (pembrolizumab) group (n=13) versus control group (n=15)	28	Median age: 66.0 (42-85)	43.0	Median TSD: 8 years (0.8-30.0); median TSD of metastatic disease: 2.8 years (range: 0.18-11.0)	<i>FACT-G</i> Total 89.5 (9.7) EW 20.2 (2.6) <i>ESAS</i> (intervention versus usual care group) depression 0.5 versus 0.4 anxiety 0.9 versus 0.5 <i>HADS-A</i> 3.0 (2.3) <i>HADS-D</i> 4.3 (3.4) <i>HADS-Distress</i> 7.3 (4.9)	Patients with metastatic melanoma
Lai-Kwon, 2019, Australia	Cross-sectional survey study	Quality of Life; anxiety; fear of recurrence or progression or death	Recruitment via weekly review of the Melanoma Service clinic lists	Metastatic melanoma; immune checkpoint inhibitors (ICI) (n=69) or BRAF and MEK inhibitors (Bmi) (n=36); ICI (n=39): 57% were receiving ongoing treatment, 17 ceased due to toxicity, Bmi (n=31): 85% were receiving ongoing treatment, and 4 ceased due to toxicity	105	Median age: 62.0 (24-88)	43.0	Mean TSD: ≤12 months (20%), 12-24 months (29%), >24 months (51%)	No outcomes of validated measures were reported	Long term responders; metastatic melanoma patients

McFarland, 2019, USA	Cross-sectional survey study	Anxiety; depression; distress	Recruitment via treating staff members, not further specified	Adenocarcinoma non-small cell lung cancer (71.8%), small cell lung cancer (16.5%), squamous cell carcinoma (6.4%), unspecified type of lung cancer (4.6%); chemotherapy (45.2%), immunotherapy (33.7%), targeted therapies (21.2%), and 5.5% missing treatment	109	65.9	62.4	15.4 months (SD: 17.3)	<i>HADS-A</i> 5.39 (3.94) <i>HADS-D</i> 4.9 (3.7) <i>DT&PL</i> 3.91 (2.96)	Patients with metastatic lung cancer undergoing treatment; patients with stage IV lung cancer who were receiving anticancer treatment
McFarland (Shaffer), 2019, USA	Cross-sectional survey study	Anxiety; Depression	Recruitment via treating staff members, not further specified	Adenocarcinoma non-small cell lung cancer (71.8%), small cell lung cancer (16.5%), squamous cell carcinoma (6.4%), unspecified type of lung cancer (4.6%); chemotherapy (45.2%), immunotherapy (33.7%), targeted therapies (21.2%), and 5.5% missing treatment	109	65.9	62.4	15.4 months (SD: 17.3)	<i>HADS-A</i> 5.39 (3.94) <i>HADS-D</i> 4.9 (3.7)	Metastatic lung cancer patients receiving immunotherapy, targeted therapies, or anti-cancer treatments
Mir, 2018, France	Case-control study	Depression; mood changes	Consecutive sampling;	Metastatic breast cancer; everolimus and hormone therapy (n=20), or hormone therapy (n=20)	40	Everolimus plus hormone therapy: 62.2 (51.1-74.6), hormone therapy: 62.9 (51.6-72.0)	100	NR	<i>BDI</i> 7.15 (5.48) versus 7.15 (4.36) <i>MADRS</i> 14.0 (4.09) versus 14.6 (3.6) for hormone therapy group versus everolimus plus hormone therapy group	Post-menopausal patients with metastatic, estrogen receptor positive breast cancer resistant or refractory to aromatase inhibitors; patients with metastatic breast cancer treatment
Miyake, 2014, Japan	Case-control study	Health-related Quality of Life	Recruitment not further specified	Metastatic renal cell carcinoma; tyrosine kinase inhibitors	240	Median age: 62.5 (37-86)	22.0	NR	<i>SF-36</i> overall score not reported	Metastatic renal cell carcinoma patients treated with TKIs; patients with

				(sorafenib, sunitinib, axitinib)						metastatic cancer; patients with metastatic diseases who are incurable and have a limited life expectancy
Moscetti, 2017, Italy	Multi-center prospective observational study	Health-related Quality of Life	Recruitment via four Italian cancer centers	Metastatic breast cancer; eribulin mesylate	50	64.0 (31-85)	100	NR	ESAS 32.6 (19.4) FACT-G 56.7 (12.9) FACT-B 78.1 (16.5)	Patients with advanced breast cancer
Mu, 2004, China	Prospective pre-post cohort study	Quality of Life	Recruitment via Peking union medical college hospital	Squamous-cell carcinoma (32.3%), adenocarcinoma (64.5%); gefitinib (EGFR-TKI); at least one platinum-based regimen and most had received more than two regimens (different combinations including platinum, taxane, docetaxel and gemcitabine)	31	Median age: 64.0 (28-85)	42.0	NR	EORTC QLQ-C30 QL 36.0 (24.7) EF 67.67 (28.39)	Patients with advanced or metastatic non-small-cell lung cancer
Mulder, 2014, The Netherlands	Cross-sectional survey study	Mood; psychological wellbeing	Recruitment of patients via treating specialists; recruitment of controls via acquaintances of the patients and by advertisements in local papers	Metastatic renal cell carcinoma (mRCC) or gastrointestinal stromal tumors (GIST); VEGFR sunitib or sorafenib	30	60.0 (38-81)	10.0	NR	SCL-90-R Total 123.10 (24.13) Anxiety 13.07 (3.10) Depression 23.87 (6.31) BDI-II 9.87 (5.76)	Patients with metastatic renal cell carcinoma
O'Reilly, 2020, UK	Cross-sectional survey study	Health-related Quality of Life	Recruitment via the melanoma clinic in the outpatients department at the Royal Marsden NHS foundation trust of all eligible patients	Metastatic melanoma; immune checkpoint inhibitors: ipilimumab (19%), pembrolizumab (37%), nivolumab (21%), ipilimumab plus nivolumab (14%), blinded clinical trial (8%)	73	Median age: 65.0 (22-86)	36.0	NR	SF-36 GH 65.3 RE 78.5	Metastatic melanoma survivors; patients with a diagnosis of metastatic melanoma who achieved a durable response to an ICI
Osoba, 2002, USA	Randomized controlled trial	(Health-related) Quality of Life	Secondary analysis of prospective longitudinal questionnaires as part of an RCT	Metastatic breast cancer; chemotherapy with (n=208) or without trastuzumab (n=192)	400	53.0 (25-76) versus 52 (25-72) for trastuzu	100	NR	EORTC-QLQ-QL 59 (26) versus 58 (25) EW 67 (23) versus 66 (26) for trastuzumab+chemoth	Patients with metastatic breast cancer

						mab+chemotherapy versus chemotherapy alone			erapy versus chemotherapy alone	
Oswald, 2019, USA	Cross-sectional survey study	Optimism	Recruitment via the urology and medical oncology clinics at VUMC and from the ZERO website	Metastatic prostate cancer; systemic treatment not further specified	100	68.3 (SD=8.7)	0.0	NR	<i>Lot-R</i> 19.6 (4.31)	Patients with (incurable) metastatic prostate cancer
Goebell, 2014, Germany	Cross-sectional survey study	Health-related Quality of Life	Recruitment via a multicentre, prospective, noninterventional clinical mRCC Registry. (i.e. the mRCC registry, NCT00610012)	Advanced or metastatic renal cell carcinoma (RCC); sunitinib (n=50), sorafenib (n=15), temsirolimus (n=16), bevacizumab in combination with interferon alpha (n=11), everolimus or interferon alpha (n=6)	98	Median age: 70.5	27.4	NR	<i>FACT-G</i> 73.5 (18.3)	Patients with advanced or metastatic renal cell carcinoma
Parente, 2017, Australia	Results from a randomized controlled trial	Quality of Life; happiness; mental health; coping; relationships; self-worth	Recruitment from eighteen Australian sites enrolled in a worldwide early access program study	Metastatic prostate cancer; cabazitaxel after docetaxel-based treatment	104	Median age: 70.0 (43-89)	0.0	Median TSD: 53.93 months (36.5-82.4); median time since mCRPC diagnosis: 19.97 months (11.2-34.2)	<i>Australian Quality of Life (AQoL-8D) questionnaire</i> 0.7 (0.2) psychological subscale 0.4 (0.2)	Patients with metastatic castration-resistant prostate cancer (mCRPC)
Patasius, 2019, Lithuania	Retrospective cohort study	Suicide	Prostate cancer cases diagnosed stage III or IV were extracted from the Lithuanian population-based Cancer Registry database; ICD-10-codes were identified	Prostate cancer stage III (86.3%) or stage IV (13.7%); androgen deprivation therapy	5156	NR	0.0	NR	32 suicides were reported. No validated questionnaires were reported	Patients with advanced prostate cancer
Paterson, 2018, Scotland	Pilot randomized controlled trial	Depression; anxiety; Health-related Quality of Life; self-efficacy	Recruitment via four hospitals in Scotland	Metastatic prostate cancer; androgen deprivation therapy	38	74.9 (SD=8.2, range: 60-86) in the	0.0	7-56 months	<i>Self-management Self-Efficacy Scale (SES)</i> 3.5 (0.8); <i>EORTC-QLQ-C30 QL</i> 73.5 (22.2) EF	Patients with metastatic prostate cancer on hormonal treatment

						intervention group; 77.5 years (SD: 6.2; 66-93) in the standard care group			87.5 (15.6) <i>HADS-A</i> 2.9 (3.4) <i>HADS-D</i> 3.6 (3.6)	
Peters, 2014, The Netherlands	Cross-sectional survey study	Coping; fear of disease progression; social support and interactions; depressive mood related to fatigue	Recruitment via the department of Medical Oncology of a university and a regional hospital in the south eastern part of the Netherlands via preselection by the treating physician	Advanced, incurable cancer: 30% breast cancer, 30 gastrointestinal cancer, 11% urogenital cancer, 9.5% gynecological cancer, 9.5% bone and soft tissue cancer, 10% other cancers; palliative (symptom reducing or life prolonging) therapy: 53% chemotherapy, 15% oral targeted therapy, 15% hormonal therapy, 14% chemotargeted therapy, 1% radiotherapy, 1% chemo-radiotherapy, 1% no treatment	137	59.0 (30-79)	61.0	NR	<i>Subscale acceptance of the Illness Cognition Questionnaire</i> 17 (4.3) <i>HADS-A</i> 6 (4.3) <i>HADS-D</i> 4 (3.6)	Patients with advanced incurable disease; patients on active treatment for various incurable cancers
Peters, 2016, The Netherlands	Longitudinal prospective cohort study	Non-acceptance of having incurable cancer; anxiety; depressive mood; social support	Recruitment via the department of Medical Oncology of a university and a regional hospital in the south eastern part of the Netherlands via preselection by the treating physician	Advanced, incurable cancer: 30% breast cancer, 30 gastrointestinal cancer, 11% urogenital cancer, 9.5% gynecological cancer, 9.5% bone and soft tissue cancer, 10% other cancers; palliative (symptom reducing or life prolonging) therapy: 53%	137	59.0 (30-79)	61.0	NR	<i>Subscale acceptance of the Illness Cognition Questionnaire</i> median score 17 <i>HADS-A</i> median score 5 <i>HADS-D</i> median score 4	Patients with advanced cancer receiving palliative cancer treatment; patients with incurable cancer (while on treatment)

				chemotherapy, 15% oral targeted therapy, 15% hormonal therapy, 14% chemotargeted therapy, 1% radiotherapy, 1% chemo-radiotherapy, 1% no treatment						
Rouanne, 2013, France	Prospective cohort study	Health-related Quality of Life; depression	Consecutive sampling; recruitment via phase I oncology trials at Institut Gustave Roussy (Villejuif, France)	Prostate cancer (n=3), testis cancer (n=1), renal cell carcinoma (n=1), endometrial and cervical (n=6), breast cancer (n=10), ovarian cancer (n=4), pancreas cancer (n=2), pleural mesothelioma (n=2), gastric cancer (n=3), colorectal cancer (n=9), non-small cell lung cancer (n=4), small cell lung cancer (n=5), head and neck cancer (n=6), sarcoma (n=1), melanoma (n=6); targeted anticancer drugs in phase I clinical trials	63	54.7	39.7	Mean TSD: 41 months	<i>SF12; BDI</i>	Advanced or metastatic cancer patients referred to Phase I oncology trials; patients with advanced or metastatic disease included in Phase I oncology trials; advanced cancer patients
Schuurhuizen (Braamse, Konings), 2019, The Netherlands	Secondary analysis data from a randomized clinical trial	Health-related Quality of Life; depression; anxiety; psychological distress; Quality of Life	Analyses are based on 349 outpatients, recruited for a RCT throughout 16 hospitals in the Netherlands	Metastatic colorectal cancer; starting with first-line systemic palliative chemotherapy	349	66.1 (SD=10.2)	35.8	Age at diagnosis: 23-83	<i>HADS; DT&PL; EORTC-QLQ-C30</i>	Patients with metastatic colorectal cancer (receiving first line systemic treatment)
Schuurhuizen (Braamse, Beekman), 2019, The Netherlands	Multicentre, clustered randomized trial	Quality of Life; depression; anxiety	Recruitment via the medical oncology departments of 16 participating hospitals in the Netherlands	Metastatic colorectal cancer; starting with first-line systemic palliative chemotherapy	349	66.1 (SD=10.2)	35.8	TSD: < 1.5 months: 33.2%, 1.5-10 months: 32.9%, >10 months: 33.2	<i>HADS 9.52 (6.6) EORTC-QLQ-C30 QL 63.0 (21.8) EF 77.1 (18.9)</i>	Patients with metastatic colorectal cancer
Selvi, 2020, Germany	Prospective cohort study	Health-related Quality of Life; post-traumatic	Recruitment not further specified	Metastatic prostate cancer; luteinizing hormone-releasing	60	69.83 (SD=5.3)	0.0	NR	<i>Post-traumatic stress disorder-civilian version</i>	Patients with metastatic prostate cancer

		stress disorder (PTSD)		hormone (LHRH) analogue treatment (n=60)					(PTSD-CV); SF-36 Baseline results NR	
Sherliker, 2000, UK	Feasibility study/mixed-methods	Coping; psychological well-being; mental adjustments; mood symptoms	Recruitment via phase I clinical trials at the ICRF Medical Oncology Unit in Oxford, UK	Advanced metastatic cancer including lung cancer, breast cancer, colon cancer and kidney cancer; combination of fluorouracil, folinic acid and interferon (n=8) or experimental drugs (n=2)	10	45-71	60.0	NR	MAC Anxious preoccupation 23.3 (4.0) Fatalism 19.3 (3.3) Fighting spirit 50.4 (6.2) Helpless/hopeless 9.9 (3.1) HADS-A 5.1 (1.5) HADS-D 2.9 (2.2) POMS Baseline results NR	Patients with advanced cancer; patients with metastatic cancer; patients with advanced metastatic cancer
Shin, 2016, USA	Cross-sectional survey study	Quality of Life; depression; anxiety	Consecutive recruitment via a trained research assistant at the ambulatory care clinic at the Massachusetts General Hospital Cancer Center through electronic medical records	Metastatic breast cancer; receiving endocrine therapy (n = 40) or chemotherapy (n=100)	140	66.0 (SD=11.3) for endocrine therapy, 58.6 (SD: 11.8) for chemotherapy	100	NR	FACT-B 111.6 (18.4) versus 104.9 (20.0) EW 17.9 (3.6) versus 17.0 (4.6) HADS-A 4.8 (3.4) versus 5.7 (4.1) HADS-D 3.0 (3.1) versus 4.5 (3.7) for endocrine therapy versus chemotherapy respectively	Patients with metastatic breast cancer

Table S3. Data-extraction table of qualitative studies.

Author	Objectives	Study design	Recruitment	Patients	Sample size (n)	Mean age (years)	Female sex (%)	Time since diagnosis	Data analysis	Terminology to refer to patient group
Brown, 2015*, The Netherlands	To focus on ongoing, embodied and negotiated processes of sense-making and expectation-construction amidst uncertainty; explore hope, trust and their influence on the illness, medicines and trial experiences of participants	Interviews, field notes	Purposeful recruitment; across phase II or III clinical trials, through a regional hospital and an urban academic hospital	Pancreatic cancer (53.8%), multiple myeloma (23.1%), renal cancer (15.4%), intestinal cancer (7.7%); clinical trial medication (not further specified)	13	63.0	30.8	NR	Interpretative phenomenological approach (IPA)	Advanced-stage cancer diagnoses and limited prognoses
Catt, 2019*, UK	To explore experiences of treatment decisions, information provision, perceived benefits and harms of treatment and the effects of these on patients' lives	Interviews	Consecutive sampling; across 20 hospitals in England, Scotland, Wales	Metastatic castrate-resistant prostate cancer (mCRPC); abiraterone, enzalutamide, docetaxel, radium-223, cabazitaxel, steroid switch + abiraterone, goserelin, docetaxel + AZD5363, or enzalutamide + radium-223	37	Partnered men (89.2%): 70.8 (56-89); single men (10.8%): 80.5 (71-91)	0.0	NR	Thematic analysis	Advanced prostate cancer; progressive advanced prostate cancer; treatment has stopped working; the cancer has spread; aggressive prostate cancer; cancer is metastatic
Grimsbo, 2011**, Norway	To explore the use and content of patients' e-mail messages sent to oncology nurses and thus gain a "snapshot" of patients' experiences of living with cancer as expressed through these messages	Analysis of 276 messages from patients to oncology nurses	Convenience sampling; recruitment via advertisements in the newspaper, on the Norwegian Cancer Society's Website, and its membership magazine, and through information pamphlets mailed to patients from the Norwegian National Cancer Registry	Breast cancer (63.3%) or prostate cancer (36.7%); currently receiving active treatment, not further specified	60 (16.7% patients with metastases)	Breast cancer: 52 (SD=7.9); prostate cancer: 65 (SD=7.6) (35-77)	Breast cancer: 100; prostate cancer: 0.0	n=25 >1 year; n=34 <= 1 year	Qualitative content analysis	Patients with metastases
Grunfeld, 2012, UK	To explore the experience and impact of andropause symptoms (particularly hot flashes) among men being treated with ADT	Interviews	Sampling from a clinic database at a large London teaching hospital	Metastatic prostate cancer; receiving androgen deprivation therapy (ADT)	21	78.0 (68-92)	0.0	NR	Qualitative methodology based on the framework approach	Metastatic prostate cancer patients

	for metastatic prostate cancer									
Holmstrom, 2019*, USA	To develop a conceptual model that describes patients' experiences of living with chemotherapy-naïve metastatic castration-resistant prostate cancer	Interviews	Patients were identified from users of the Health Unlocked social network in USE. Physicians were identified via an external database	Chemotherapy-naïve metastatic castration-resistant prostate cancer; hormonal therapy (n=18); anti-androgens (n=13); abiraterone (n=6); bicalutamide (n=7); bisphosphonates (n=11)	19	Median age: 67.0 (51-78)	0.0	Median TSD of metastasis: 4.8 years (range: 1.0-13.0)	Grounded theory	Chemotherapy-naïve metastatic castration-resistant prostate cancer
Hulin, 2017*, UK, France, Germany, Italy, Spain	To expand the current knowledge on how relapse affects both patients and physicians	Interviews (including verbal rating scales)	Haematologists were asked to identify and nominate patients with RRMM who would be willing to participate, by using their own judgement	Relapsed or refractory multiple myeloma; targeted therapy: currently receiving lenalidomide (32%) or bortezomib (16%), previously receiving lenalidomide (44%), bortezomib (44%), thalidomide (44%)	50	Median age: 71.0 (51-85)	44.0	NR	Not specified	Patients with relapsed and/or refractory metastatic myeloma (RRMM)
Kaufman, 2018, Germany, USA	To provide a comprehensive overview of the impact of MCC and its management on patients' lives prior to diagnosis, at diagnosis, and after diagnosis, and to develop a disease model of adults with metastatic MCC	Interviews	Patients participating in the single-arm, open-label, multicentre, international phase 2 JAVELIN Merkel 200 trial were invited to participate in optional qualitative interviews in all countries (Australia, Austria, Canada, France, Germany, Italy, Spain, Switzerland, and the USA), except Japan where interviews were viewed as culturally insensitive	Stage IV, chemotherapy-refractory, histologically confirmed merkel cell carcinoma; avelumab followed by surgery/radiotherapy	19	72.2 (SD=8.2)	21.0	Mean TSD: 2.3 years (SD: 0.8)	Thematic analysis	Patients with advanced and metastatic MCC; late-stage (advanced or metastatic), non-resectable MCC
Kvale, 2018, Norway	To gain insight into the illness narratives of cancer patients, from the day they suspected that something was wrong up to the present day where they are living with incurable cancer,	Interviews	Purposive, non-probability sampling via an outpatient clinic	Metastasized cancers in the palliative phase: colon cancer (n=6), breast cancer (n=4), brain tumor (n=1), prostate cancer (n=1), peritoneum cancer(n=1); palliative,	13	47-79	53.8	0.5-5 years	Thematic narrative analysis, supplied with some elements from structural	Living with life-prolonging chemotherapy; incurable cancer; patients living with life-prolonging chemotherapy; seriously ill cancer patients; non-curable cancer

	undergoing life prolonging chemotherapy			life-prolonging chemotherapy					narrative analysis	
Levy, 2019, Australia	To explore the lived experience of being on pembrolizumab treatment for advanced melanoma	Interviews	Purposive sampling; recruitment of patients was across two cohorts (details reported elsewhere)	Metastatic melanoma; pembrolizumab	26	66.0 (41-84)	25.0	NR	Thematic analysis using interpretative phenomenological analysis (IPA)	Metastatic melanoma patients; patients living with advanced melanoma
Macdonald, 2012*, Canada, USA, Brazil, France, Germany, Russia, Spain	To explore the experiences and emotions of patients through GIST diagnosis, treatment initiation, disease control, and in some patients, loss of response and therapy switch	Interviews	Recruitment via individual clinical practice centres	Metastatic or unresectable gastrointestinal stromal tumors (GIST); Imatinib	50	NR	NR	NR	Ethnographic approach: multiple, in-context techniques, including individual and group interviews, life histories, and participant observation, were used	Patients with resected or metastatic/unresectable GIST
Milne, 2019*, Australia	To understand the experiences of patients with advanced melanoma who received immunotherapy and their carers; and to explore the impact of immunotherapy treatment (in particular side-effects) on patients' and carers' quality of life	Interviews	Purposive sampling from a specialist cancer centre in Melbourne, Australia	Stage IV melanoma; pembrolizumab (57%); nivolumab (13%); ipilimumab (9%); currently not receiving treatment (22%)	23	59.0 (SD=15, 32-86)	22.0	NR	Interpretive description	Patients with advanced melanoma; patients with stage IV melanoma; diagnosis of an incurable/chronic disease
Mohammed, 2020*, Canada	To examine how people with late-stage cancer and their healthcare providers enacted the process of medicalisation through engaging in the search for oncological treatments, such as experimental drug trials, despite the incurability of their disease	Interviews, documents, field observations	Purposeful sampling; recruitment from an ambulatory palliative cancer clinic in a comprehensive cancer centre; and snowball sampling for participants with cancer to refer family members, informal caregivers and healthcare providers that they identified as important to their search for treatments	Advanced cancer: prostate cancer, bone marrow cancer, breast cancer, pancreas cancer; receiving a variety of allopathic therapies and informal therapies (not further specified)	7	Late 30s-early 70s	43.0	6 months - 5 years	Inductive coding, guided by a critical discourse analytical framework	Advanced cancer, incurable illness, people with late-stage cancer, terminal cancer, chronic illness that one could potentially survive, people with advanced, metastatic and life-limiting cancer

Mosher, 2013, USA	To identify concerns among distressed women with metastatic breast cancer with an emphasis on their experience of physical and emotional distress, social constraints, and existential issues	Analysis of 176 essays from home-based expressive writing trial	Recruitment via an invitational letter for an expressive writing intervention trial, after giving approval for contact via their oncologist	Stage IV breast cancer; hormonal therapy (77.3%), chemotherapy (97.7%)	44	57.9 (SD=12.1)	100	Mean TSD: 4.1 (SD: 3.1)	Theoretical thematic analysis of essays	Living with metastatic breast cancer; incurable illness; long-term survivor; advanced cancer patients
Pujol, 2018, France	To investigate patient's thoughts and attitudes that determine the decision to undergo second-line chemotherapy	Interviews	Purposive sampling; consecutive participants admitted to receive chemotherapy (second-line or third-line/palliative intent) for a lung cancer in the thoracic unit of the Montpellier academic hospital	Advanced non-small cell or small cell lung cancer; second-line or palliative chemotherapy	33	61.8 (SD=7.9)	33.0	NR	Grounded theory	Cancer patients in a palliative situation
Finlayson, 2017, USA	To understand the lived experience of being aware of disease status among women with recurrent ovarian cancer	Interviews	Purposive sampling; recruitment from the outpatient gynecological medical service of one large metropolitan cancer center via six different medical oncologists	Recurrent ovarian cancer; currently receiving chemotherapy	12	58.0 (44-74)	100	< 2 years: 8.3%; 2-3 years: 33.3%; 3-4 years: 16.7%; 4-5 years: 8.3%; 5+ years: 33.3%	A modified Colaizzi's seven-step method	Advanced(-stage)ovarian cancer patients; women with recurrent ovarian cancer
Thorne, 2013, Canada	To glean insights from the patient perspective as to what constitutes helpful and unhelpful clinical communication, and to determine how patients' needs and preferences in relation to such communication change over time within the cancer journey	Interviews	Purposive sampling; voluntary samples and recruited through multiple approaches	Chronic advanced metastatic cancer: breast cancer (n=8); hematological (n=5); gastrointestinal (n=2); receiving novel cancer therapies (not further specified)	15	55.5 (32-72)	NR	NR	Interpretive description	Persons surviving for extended periods with advanced disease; incurable and life-limiting metastatic conditions; patients living longer with serious disease; chronic advanced cancer; chronic metastatic cancer; longstanding advanced metastatic cancer patients
Wickersham, 2014, USA	To explore the process of medication-taking for adults with non-small cell lung cancer receiving oral EGFR	Interviews	Purposive sampling; recruitment at two outpatient lung cancer clinics at the National Cancer Institute	Non-small cell lung cancer; EGFR-treatment erlotinib	13	70.5 (52-83)	61.5	NR	Constant comparative analysis, grounded theory,	Surviving with lung cancer; surviving with metastatic cancer; life-limiting illness without cure; not survive after,

	therapy, to develop a grounded theory that described and explained the process of medication-taking in this patient population		designated cancer center						questioning the data, dimensional analysis, matrix construction, writing case titles and story summaries, and a literature review	but with lung cancer; chronic life-threatening condition
Wong, 2019, Australia	To explore real-world experiences of patients with advanced melanoma currently receiving pembrolizumab, focussing on factors that influenced their treatment decision-making	Interviews	Purposive sampling; recruitment of patients from a specialist cancer center in Melbourne, Australia	Stage IV melanoma; pembrolizumab; prior treatment ipilimumab (22%) or dabrafenib/trametinib (9%)	23	68.0 (SD=12, 34-92)	13.0	NR	Thematical analysis	Stage IV melanoma; advanced melanoma
Al Achkar, 2020, USA	To characterise the unmet needs of patients with advanced lung cancer on targeted therapy and to explore how their healthcare experiences with clinicians and care teams can be improved	Interviews	Recruitment via online closed oncogene-focused lung cancer groups of patients and their caregivers (Facebook, ROSOneder, EGFR Resisters)	Advanced or metastatic non-small cell lung cancer stage IV (95%) or stage IIIb (5%); targeted therapy (not further specified)	39	Median age: 48 (30-75)	71.8	Median TSD: 21 months (3-81)	Critical theory-based analysis methods	Patients with advanced lung cancer on targeted therapies
Gray, 2020, South Africa	To report experiences of men in South Africa treated with ADT to share their perceived effects of the treatment	Interviews	Recruitment via an urban oncology clinic in Pretoria, South Africa	Advanced prostate cancer; androgen deprivation therapy (ADT)	22	63-78	0.0	NR	NR	Prostate cancer patients
Poort, 2021, USA	To explore patients' experiences of PARPi-related fatigue and its impact on their lives	Interviews	Purposive sampling; potentially eligible participants were identified using an EPIC workbench that identified patients with a PARPi listed in the electronic records' medication section	Advanced ovarian cancer stage I-II (22%), stage III (70%), stage IV (13%); receiving oral PARP inhibitors	23	63.0 (50-86)	100	Mean TSD: 3 years (0-11)	Thematic analysis	Ovarian cancer patients on maintenance PARPi
Walsh, 2021, USA	To explore how lung cancers survivors engage in online support	Interviews	Purposive sampling; recruitment via oncogene-specific	Advanced lung cancer stage IV (95%) or stage IIIb (5%); targeted	40	Median age: 49.0 (30-75)	70.0	Median TSD: 19.5	Thematic analysis	Lung cancer survivors

	communities and what the psychological, social and physical impacts of such engagement are		online lung cancer support groups: EGFR Resisters, ALK-Positive Facebook Group and the ROS1ders	therapies (not further specified)				months (3-152)		
Buiting, 2013, The Netherlands	To explore the extent to which patients have a directing role in decisions about chemotherapy in the palliative phase of cancer and (want to) anticipate on the last stage of life	Interviews	Purposive sampling; via a palliative care nurse who traced and invited potentially eligible patients	Colon cancer (66.6%) or breast cancer (33.3%); indication second line chemotherapy (n=1); second line chemotherapy (n=4); indication third line chemotherapy (n=1); indication third line immunotherapy (n=1); third line chemotherapy (n=2); (indication) third/fourth line chemo-immuno-/targeted therapy (n=2)	15	65.0 (48-85)	53.3	NR	Thematic content analysis	Patients with advanced colorectal and breast cancer
Karlsson, 2014, Sweden	To interpret meanings of existential uncertainty and certainty for people diagnosed with advanced gastrointestinal cancer and receiving palliative treatment	Interviews	Recruitment via an oncological outpatient clinic that specialises in palliative care for gastrointestinal cancer	Gastrointestinal cancer with various metastases; palliative treatments (not further specified)	14	49-79	50.0	2 months - 20 years	Naive reading, structural analysis and interpreted whole (in line with Ricoeur's theory of interpretation)	People diagnosed with advanced gastrointestinal cancer and receiving palliative treatment
Svensson, 2009, Sweden	To explore psychological reactions and coping at disease progression after first-line chemotherapy among women with metastatic breast cancer participating in a randomized clinical trial	Interviews	Women included in a randomized phase III study were asked to participate	Metastatic breast cancer; chemotherapy: epirubicin and paclitaxel with or without capecitabine	20	56.3 (6.2)	100	TSD to PD first line: 2 - 20 years	Content analysis	Women with metastatic breast cancer
Brown, 2015*, The Netherlands	To focus on ongoing, embodied and negotiated processes of sense-making and expectation-construction amidst uncertainty; explore hope, trust and their influence on the	Interviews, field notes	Purposeful recruitment; across phase II or III clinical trials, through a regional hospital and an urban academic hospital	Pancreatic cancer (53.8%), multiple myeloma (23.1%), renal cancer (15.4%), intestinal cancer (7.7%); clinical trial medication (not further specified)	13	63.0	30.8	NR	Interpretative phenomenological approach (IPA)	Advanced-stage cancer diagnoses and limited prognoses

	illness, medicines and trial experiences of participants									
Catt, 2019*, UK	To explore experiences of treatment decisions, information provision, perceived benefits and harms of treatment and the effects of these on patients' lives	Interviews	Consecutive sampling; across 20 hospitals in England, Scotland, Wales	Metastatic castrate-resistant prostate cancer (mCRPC); abirateron, enzalutamide, docetaxel, radium-223, cabazitaxel, steroid switch + abiraterone, goserelin, docetaxel + AZD5363, or enzalutamide + radium-223	37	Partnered men (89.2%): 70.8 (56-89); single men (10.8%): 80.5 (71-91)	0.0	NR	Thematic analysis	Advanced prostate cancer; progressive advanced prostate cancer; treatment has stopped working; the cancer has spread; aggressive prostate cancer; cancer is metastatic
Grimsbo, 2011**, Norway	To explore the use and content of patients' e-mail messages sent to oncology nurses and thus gain a "snapshot" of patients' experiences of living with cancer as expressed through these messages	Analysis of 276 messages from patients to oncology nurses	Convenience sampling; recruitment via advertisements in the newspaper, on the Norwegian Cancer Society's Website, and its membership magazine, and through information pamphlets mailed to patients from the Norwegian National Cancer Registry	Breast cancer (63.3%) or prostate cancer (36.7%); currently receiving active treatment, not further specified	60 (16.7% patients with metastases)	Breast cancer: 52 (SD=7.9); prostate cancer: 65 (SD=7.6) (35-77)	Breast cancer: 100; prostate cancer: 0.0	n=25 >1 year; n=34 ≤ 1 year	Qualitative content analysis	Patients with metastases

Table S4. Data-extraction table of mixed-methods studies.

Author	Study design	Psychosocial outcomes	Recruitment	Patients	Sample size	Mean age (years)	Female sex (%)	Time since diagnosis	Quantitative baseline results (mean (SD))	Terminology patient group
Ito, 2018, UK, France, Germany, Italy, Spain	Cross-sectional mixed-methods: interviews, questionnaires	Quality of Life; Experiences of chemotherapy in combination with androgen deprivation therapy	Recruitment via five European countries	Metastatic hormone-sensitive prostate cancer; chemotherapy (docetaxel) in combination with androgen deprivation therapy	Interviews: 31; questionnaires : 161	Interviews: 41-50 (n=1), 51-60 (n=11), 61-70 (n=11), 71-80 (n=8); questionnaires: ≤40 (n=6) 41-50 (n=8), 51-60 (n=30), 61-70 (n=64), 71-80 (n=50), ≥ 81 (n=3)	0.0	NR	<i>FACT-P</i> 92.4 (21.9) <i>EW</i> 15.0 (5.7) <i>EQ-5D-5LVAS</i> 60.7 (17.3)	Men with metastatic hormone-sensitive prostate cancer; metastatic hormone-sensitive prostate cancer patients
Paterson, 2017, Scotland	Cross-sectional mixed-methods: interviews, questionnaires	Quality of Life; Experience of unmet supportive care needs	Purposive sampling; recruitment via a main cancer centre in Scotland	Locally advanced and metastatic prostate cancer; hormonal treatment	Interviews: 8, questionnaires : 31	80.1 (SD= 6.9)	0.0	1-2 years	<i>EORTC-QLQ-C30</i> GH 69.6 (23.9) EF 88.2 (16.9)	Men affected by prostate cancer on hormone therapy
Ihrig, 2020, Germany	Cross-sectional mixed-methods: interviews, questionnaires	Possible prejudices, biases, unrealistic expectations and misconceptions about immunotherapy	Consecutive sampling; recruitment via the university hospital Heidelberg	Advanced cancer: immune checkpoint inhibitors (ICI) (n=53): dermatological tumours (43%), thoracic tumours (38%), gastrointestinal tumours (4%), other tumours (15%), metastasis (96%); chemotherapy (CT) (n=55): thoracic tumours (38%), gastrointestinal tumours (49%), other tumours (13%). metastasis (85%)	161	59.5 (S=11.7) versus 62.4 (SD=11.0) for ICI versus CT	40.0 for both ICI and CT group	NR	No outcomes of validated measures were reported	Advanced-stage cancer patients

Komatsu, 2020, Japan	Longitudinal mixed-methods RCT: focus group interviews, questionnaires	Self-efficacy; Quality of Life; psychological distress	Recruitment via outpatient lists by primary physicians, at the outpatient clinics of three cancer centres and one university hospital in Japan	Metastatic breast cancer; chemotherapy or targeted therapy	155	57.0 (SD=12.2) versus 59.4 (SD=11.6) for the nurse-led medication self-management programme (n=78) versus control group (n=76)	100	NR	GSE 26.7 (0.6) versus 25.7(0.8) FACT-B 90.3 (2.4) versus 92.6 (2.1) 6-item Kessler 6 (K6) 5.0 (0.5) versus 5.3 (0.5) for the nurse-led medication self-management programme versus control group	Patients with metastatic breast cancer (undergoing oral anticancer treatment)
Mieras, 2020, The Netherlands	Cross-sectional mixed-methods: interviews, questionnaires	Quality of Life	Purposive sampling for the interviews; recruitment via clinic schedules by treating oncologists via one academic and five non-academic hospitals across the Netherlands	Metastatic lung cancer; chemotherapy (36%), immunotherapy (47%), TKIs (17%)	266	65.0 (SD=9.0)	45.0	NR	EORTC-QLQ-C30 baseline means NR	Patients with metastasized lung cancer; patients diagnosed with metastatic lung cancer
Charalambo us, 2016, Cyprus	Cross-sectional mixed-methods: interviews, questionnaires	Quality of Life	Recruitment via the Out-Patients Oncology Clinics of two public hospitals in Cyprus; randomly selected patients (from the quantitative	Advanced prostate cancer; chemotherapy with docetaxel as primary or combination chemotherapy	Interviews: 15; questionnaires : 148	40–50 (16.9%); 51–60 (25.0%); 61–70 (31.8%); >70 (26.4%)	0.0	6 months-3 years: 59.5%; 4-6 years: 30.4%; 7-10 years: 4.1%; >10 years: 6.1%	EORTC-QLQ-C30 GH 56.7 (19.0) EF 48.25 (26.55)	Patients diagnosed with advanced prostate cancer (during the period of active treatment with chemotherapy)

			sample) were interviewed on the basis of the findings from the statistical analysis of the quantitative data
