

Supplementary Methods.

Asbestos exposure assessment

Occupational information was available from the baseline EPIC questionnaire. It included the occupation at enrolment and data on ever working up to the time of enrolment in 52 at-risk occupations. No information was available on duration of employment and time of first employment. A semi-quantitative job-exposure matrix (JEM) was developed by expert epidemiologists as previously described [1], assigning to each occupation an “exposure probability” and an “exposure intensity” based on occupational history data (occupational categories of the questionnaire 1-52). The “exposure probability” and “exposure intensity” were coded as: 0 = no probability/intensity; 1 = low probability/intensity; 2 = intermediate probability/intensity; 3 = high probability/intensity.

The two values (probability and intensity) are then used to build up, for each occupation, an “Exposure Index” given by “Probability of exposure” * “intensity of exposure”. The Exposure Index (EI) may thus assume the following values: 0, 1, 2, 3, 4, 6, 9. Each occupation has its own EI, which may be assigned to each individual as his/her own Exposure Index. If a participant has several occupations, a “cumulative exposure index” is computed. The cumulative exposure index is the sum of all the EIs (one for each occupation) of that individual. For participants with just one occupation the EI and the Cumulative Exposure Index coincide.

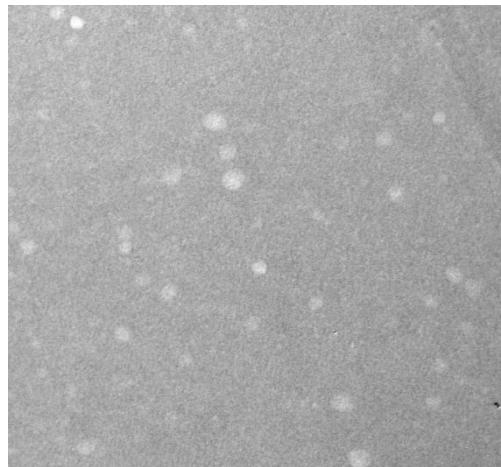

Derivative Exposure Indexes: the Exposure Index assigned to each individual according to his/her occupation (or the Cumulative Exposure Index in the case of multiple occupations) is used to build up derivative exposure indexes: a “Binary Exposure Index”, coded as: 0 = no exposure (if the Exposure Index, or cum. index in the case of multiple jobs, is < 3); 1 = exposed (if the Exposure Index, or cumulative index in the case of multiple jobs, is ≥ 3). The table below shows the 52 occupational categories and exposure matrix.

| | EPIC list of occupations | Probability of exposure | Intensity of Exposure | Exposure index | Binary exposure index |

RT-qPCR analysis

For technical confirmation of the miRNA-seq results, the RT-qPCR was performed according to TaqMan® MicroRNA Assays with custom RT pools and custom preamplification pools protocol (Thermo Fisher Scientific, USA). Briefly, four μ l of total RNA was used for RT using TaqMan miRNA Reverse Transcription Kit (Life Technologies, USA) with custom RT primer pool. Two samples (a case and its matched control) were excluded due to insufficient RNA amount, therefore RT-qPCR analysis was performed on 38 samples. The RT product (3.5 μ l) was preamplified with TaqMan PreAmp Master Mix and a custom PreAmp primer pool. PreAmp product was diluted with 0.1 xTE (10mM TrisHCl, 1mM disodium EDTA pH8.0) to final volume of 200 μ l, then 0.5 μ l of pre-amplified cDNA was used for PCR reaction with TaqMan Fast Advanced master mix. Real-time PCR was performed on CFX96 Real-Time PCR machine (BioRad, USA) according to the manufacturer's protocol. Relative gene expression was calculated using the $2^{-\Delta\Delta C_t}$ method and normalised to the endogenous control miR-92b-3p [2]. The differences in the expression of the analysed miRNAs between pre-clinical cases and cancer-free controls were assessed by the Wilcoxon test.

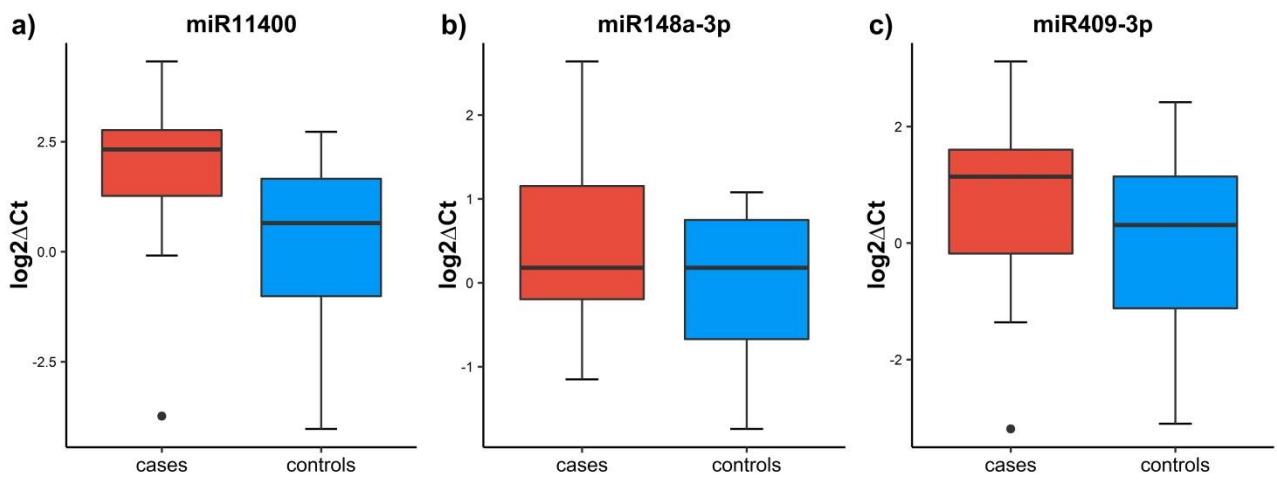

Supplementary Figures

Supplementary Figure S1. Representative micrograph of transmission electron microscopy of EVs isolated from 200 ul of serum.

Supplementary Figure S2. Representative nanoparticle tracking analysis of serum EVs showing the EVs size distribution.

Supplementary Figure S3. Results of RT-qPCR validation of miR-11400 (a), miR-148a-3p (b) and miR-409-3p (c) in 19 pre-clinical MPM samples and 19 matched controls. Box-and-whiskers plots present the first quartile, median and third quartile, minimum and maximum values and outliers that are marked outside the whiskers range. Wilcoxon's test revealed no significant difference between cases and controls.

Supplementary Tables

Supplementary Table S1. Primary sequence of miRNAs analysed by RT-qPCR.

Supplementary Table S3. Differentially expressed miRNAs between 80 pre-diagnostic MPM cases and 80 matched controls from NGS. Table shows the average expression for all identified miRNAs (base Mean), the differential expression reported as log2 fold change between cases and controls (Log2FC), the p-value from statistical analysis (p-value) and the p-value adjusted for multiple testing by FDR (p-adj).

| ID | baseMean | log2FoldChange | p-value | FDR |

Supplementary Table S4. Differentially expressed miRNAs between 20 pre-diagnostic MPM cases and 20 matched controls from NGS. Table shows the average expression for all identified miRNAs (base Mean), the differential expression reported as log2 fold change between cases and controls (Log2FC), the p-value from statistical analysis (p-value) and the p-value adjusted for multiple testing by FDR (padj). miRNAs investigated for validation are denoted in bold.

| ID | baseMean | log2FoldChange | p-value | FDR ^a |

^a number of genes enriched in the pathway^y

^b FDR is adjusted from the hypergeometric test. Fold Enrichment indicates how drastically genes of a certain pathway is overrepresented.

| nGenes ^a | Enrichment FDR ^b | Pathway Genes | Fold Enrichment ^c | Pathway | Genes |
|---------------------|-----------------------------|---------------|------------------------------|---------|-------|
|---------------------|-----------------------------|---------------|------------------------------|---------|-------|

^c Fold Enrichment is defined as the percentage of genes in the list belonging to a pathway, divided by the corresponding percentage in the background

Supplementary Table S7. miRWalk 2.0 consensus target predictions for miR-11400.

^a number of genes enriched in the pathway

^b FDR is adjusted from the hypergeometric test. Fold Enrichment indicates how drastically genes of a certain pathway is overrepresented.

^c Fold Enrichment is defined as the percentage of genes in the list belonging to a pathway, divided by the corresponding percentage in the background

Supplementary Table S9. Characteristics of the retrospective study used in the validation analysis.

| | MPM cases* | Controls** |
|-------------------------|-------------------|-------------------|
| N (%) | 30 (60) | 20 (40) |
| GENDER | | |
| M (%) | 22 (73) | 20 (100) |
| F (%) | 8 (27) | 0 (0) |
| AGE (mean±sd) | 72± 10 | 65±4 |

*MPM enrolled at Azienda Ospedaliero-Universitaria Maggiore della Carità (Novara) ; ** Cancer-free individuals enrolled at the Occupational Medicine Department of the University of Genoa and at the Oncology Department of the Villa Scassi Hospital, Genova, Italy
