

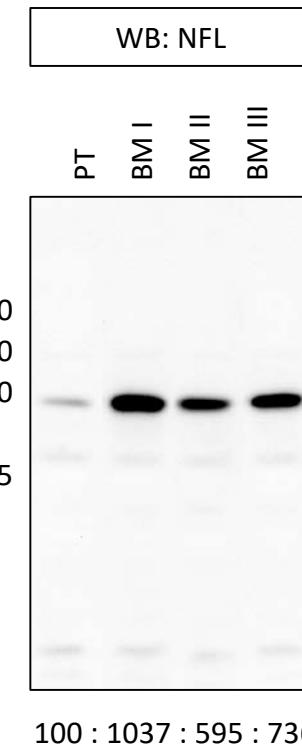

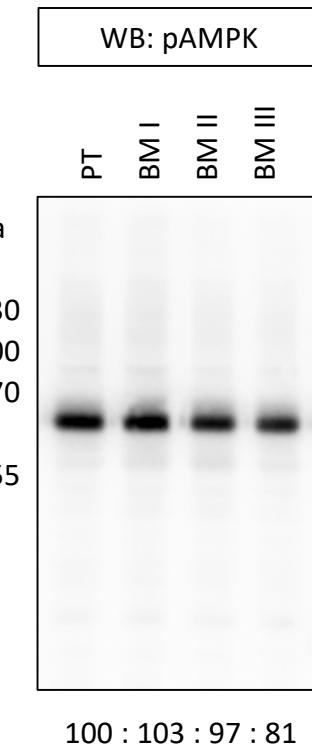

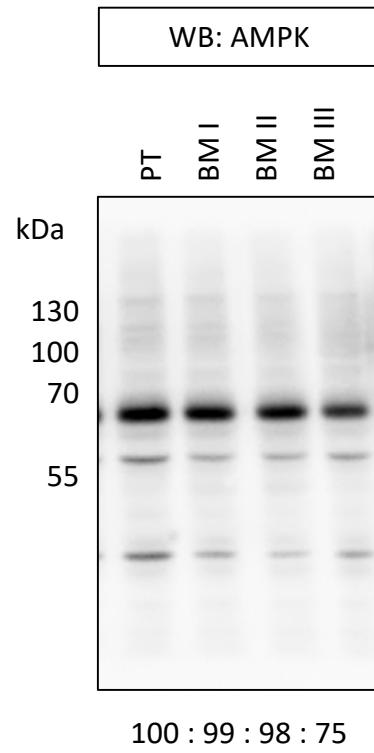

Figure S1: NFL-staining in NB-cells. Cells were treated with an Alexa-fluor488-coupled antibody against NFL (green) and the nuclei were stained with DAPI (blue). Shown is one representative image. Bar: 10 μ M

Figure S2. Original Western-blots. 20 µg protein extracts from NB cells were probed against AMPK, pAMPK or NFL by Western-blotting. Band intensities were measured by Image J, and the intensities obtained for the PT signals were set to 100%. Show is one representative Western-blot each out of three.
