1. General Information.

All reactions were carried out in oven- or flame-dried glassware under an atmosphere of dry argon or nitrogen unless otherwise noted. Except as otherwise indicated, all reactions were magnetically stirred and monitored by analytical thin-layer chromatography using SiliCycle® Inc. and EMD Millipore pre-coated silica gel plates with F₂₅₄ indicator. Visualization was accomplished by UV light (254 nm) with combination of potassium permanganate. Flash column chromatography was performed according to the method of Still ^[1] using silica gel 60 (mesh 230-400) supplied by SiliCycle® Inc. Yields refer to chromatographically and spectroscopically pure compounds, unless otherwise stated.

Commercial grade reagents and solvents were purchased from Sigma-Aldrich, Alfa-Aesar, Acros, Fisher, TCI, and VWR, and were used as received without further purification except as indicated below. Trichlorosilane was distilled over calcium hydride under an atmosphere of dry nitrogen prior to use. Dichloromethane, chloroform, and acetonitrile were freshly distilled over calcium hydride under an atmosphere of dry nitrogen prior to use. Tetrahydrofuran was freshly distilled over sodium and benzophenone under an atmosphere of dry nitrogen prior to use.

All racemic hydrazine samples were prepared by sodium cyanoborohydride reduction of corresponding hydrazones.

All ¹H NMR and ¹³C NMR spectra were obtained using a Bruker 400 Ultrashield or an Oxford AS400 Spectrometer (¹H 400 MHz, ¹³C 100 MHz) at ambient temperature in CDCl₃ purchased from Cambridge Isotope Laboratories, Inc. Chemical shifts in ¹H NMR spectra are reported in parts per million (ppm) respective to tetramethylsilane (δ

0.00 ppm) unless otherwise noted. The proton spectra are reported as follows δ (multiplicity, coupling constant J , number of protons). Multiplicities are indicated by s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), and br (broad). Chemical shifts in ^{13}C NMR spectra are reported in ppm relative to CDCl_3 (δ 77.0 ppm). All ^{13}C NMR spectra were recorded with complete proton decoupling. Infrared (IR) spectra were recorded using a Nicolet iS5 FT-IR instrument. MS data were obtained using an Agilent 6100 Quadrupole LC/MS. HRMS data were obtained at USF Mass Spec and Peptide Core Facility in Department of Chemistry at University of South Florida. Optical rotations were measured using a Jasco P2000 Polarimeter at 589 nm and were reported as $[\alpha]_{\text{D}}^{25}$, where C is reported in g/mL.

Catalytic Asymmetric Transfer Hydrogenation with Trichlorosilane.

Representative Procedure:

(*R*)-*N*-(1-Phenylethyl)benzohydrazide (3a):

A flame-dried test tube with a magnetic stir bar was charged with hydrazone **1a** (60 mg, 0.25 mmol), catalyst **2a** (15 mg, 0.025 mmol) and CH₂Cl₂ (1.0 mL), cooled to –50 °C, and then treated slowly with a solution of HSiCl₃ in CH₂Cl₂ (250 μL, 1.5 M). The reaction mixture was stirred at –40 °C for 20 hours, and then quenched by pouring it into 30 mL of saturated aqueous NaHCO₃ solution cooled to 0 °C. The resulting mixture was vigorously stirred for 30 min at room temperature and extracted twice with 15 mL of CH₂Cl₂. The combined organic layers were dried over Na₂SO₄, filtered, and condensed *in vacuo*. A ¹H NMR spectrum of the crude reaction mixture was taken with 1,1,2,2-tetrachloroethane as an internal standard (48% NMR yield). A fraction of the crude mixture was purified by prep TLC using 20% EtOAc in CH₂Cl₂ as an eluent for characterization purposes.

All spectral data were consistent with the literature values.^[2]

ee = 53 %; [α]_D²² = +7.4 (*c* = 0.00067, CH₂Cl₂); The enantiomeric excess and the absolute stereochemistry were determined by HPLC analysis:^[2] *t_R* (major) = 19.95 min; *t_R* (minor) = 29.01 min (Daicel Chiralcel® OJ-H with an OJ-H guard column, hexane/2-propanol = 90:10, 0.5mL/min).

The 1.0 mmol scale reaction:

A flame-dried Schlenck tube with a magnetic stir bar was charged with hydrazone **1a** (238 mg, 1.00 mmol), catalyst **2a** (60 mg, 0.10 mmol) and CH₂Cl₂ (4.0 mL), cooled to –50 °C, and then treated slowly with a solution of HSiCl₃ in CH₂Cl₂ (1.0 mL, 1.5 M). The reaction mixture was stirred at –40 °C for 20 hours, and then quenched by pouring it into 120 mL of saturated aqueous NaHCO₃ solution cooled to 0 °C. HRMS (ESI): Exact mass calculated for $\text{C}_{17}\text{H}_{21}\text{N}_2\text{O}^+$ $[\text{M}+\text{H}]^+$ expected: 269.1648, found: 269.1652.

ee = 14 %; $[\alpha]_D^{21} = +4.7$ ($c = 0.002$, CH_2Cl_2); The enantiomeric excess was determined by HPLC analysis: t_R (major) = 37.17 min; t_R (minor) = 30.40 min (Daicel Chiralcel® OD-H with an OD-H guard column, hexane/2-propanol = 90:10, 0.5mL/min).

(R)-N'-(4-Phenyl-3-buten-2-yl)benzohydrazide (3r):

A ^1H NMR spectrum of the crude reaction mixture was taken with 1,1,2,2-tetrachloroethane as an internal standard (**3r**: 4% NMR yield; **3q**: 19% NMR yield). A fraction of the crude mixture was purified by prep TLC using 20% EtOAc in CH_2Cl_2 as an eluent for characterization purposes. Compounds **3r** and **3q** were isolated as an inseparable mixture.

The mixture of **3r** and **3q** was analyzed by LC/MS (ES-APCI): t_R (**3r**) = 31.567 min, calculated for $\text{C}_{17}\text{H}_{19}\text{N}_2\text{O}^+$ $[\text{M}+\text{H}]^+$ expected: 267.1, found: 267.2; t_R (**3q**) = 31.344 min, calculated for $\text{C}_{17}\text{H}_{21}\text{N}_2\text{O}^+$ $[\text{M}+\text{H}]^+$ expected: 269.2, found: 269.2 (LC column: Poroshell120-EC-C18 43.0*50 mm, 2.7 μm ; 24 $^\circ\text{C}$; H_2O /Methanol=90:10; 0.5 ml/min).

Racemic **3r** was prepared by sodium cyanoborohydride reduction of the corresponding hydrazone, which also produced **3q** (**3r**:**3q** = ca. 4:1). While enantiomers of **3q** were fully separated on Daicel Chiralcel[®] OD-H (*vide supra*), enantiomers of **3r** were not separable from those of **3q**. We found out that enantiomers of **3r** were separable from those of **3q** under following HPLC condition: Daicel Chiralpak[®] AD-H with an AD-H guard column, hexane/2-propanol = 92:8, 0.5 mL/min. The first peak (t_R = 36.56) and second peak (t_R = 40.21) were the corresponding enantiomers of **3r**, and the third peak (t_R = 45.41) and fourth peak (t_R = 48.85) were the corresponding enantiomers of **3q**.

Therefore, we were able to determine the ee of **3r**, as its enantiomers were fully

separated at the base line on the Daicel Chiralpak® AD-H column. However, the enantiomeric excess of **3q** was provided as an estimated value, for the enantiomers of **3q** were not fully separated at the base line by chiral HPLC on the Daicel Chiralpak® AD-H column.

3r : ee = 15 %; The enantiomeric excess and the absolute stereochemistry were determined by HPLC analysis:^[10] t_R (major) = 40.47 min; t_R (minor) = 36.56 min (Daicel Chiralcel® AD-H with an AD-H guard column, hexane/2-propanol = 92:8, 0.5mL/min)

3q : ee = approximately 7 %; The enantiomeric excess was estimated by HPLC analysis as both enantiomers were not fully separated at the base line: t_R (major) = 45.25 min; t_R (minor) = 48.99 min (Daicel Chiralpak® AD-H with an AD-H guard column, hexane/2-propanol = 92:8, 0.5mL/min).

3. Computational Procedures.

All calculations have been performed with the Q-Chem 4 quantum chemistry code,^[11] using the PBEh-3c density functional theory composite procedure.^[12] Solvent effects have been included using the C-PCM method with the dielectric constant of DCM (ϵ = 9.08). Minima are converged within a threshold of 10^{-8} E_h, and have been confirmed minima using frequency calculations. Molecular symmetry was not used because of the necessity of the C-PCM method. The C₂ symmetry expected for the two main minima (complex 1 and complex 2) is respected in an approximate manner. The initial structures for the geometry optimizations have been obtained via a molecular mechanics based conformational search algorithm, developed in-house. Given the fact that the molecules in this project and the nature of their interaction are well within the

limits of recent validation studies of the method that we used, we expect geometries to be converged within 0.05 Å accuracy,^[14] and energies to be converged within 2 kcal/mol accuracy.^[15] The structures of the minima for the complex and the free Lewis bases are also provided in cartesian coordinates (xyz) as additional supplementary text files.
