

Screening the De-inkability of Different Surface Printing Ink Systems for Plastic Packaging with Surfactants

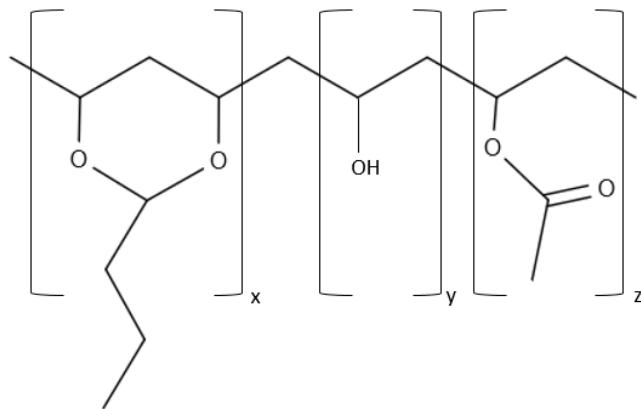

Supplement Material S1

1 Structure of the printing binder used in the study

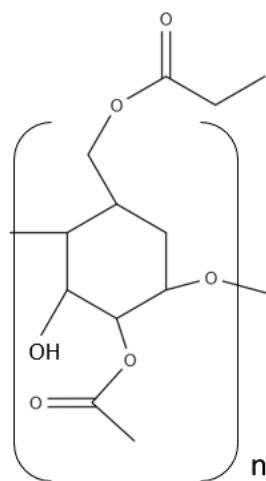

1.1 Nitrocellulose NC

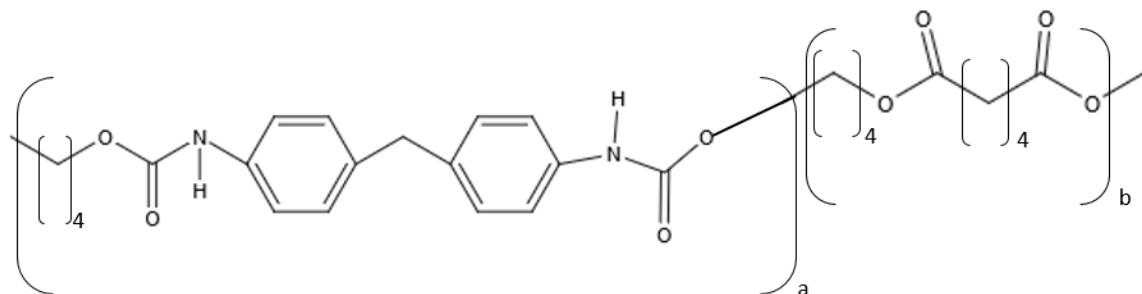

1.2 Polyvinyl butyral (PVB)

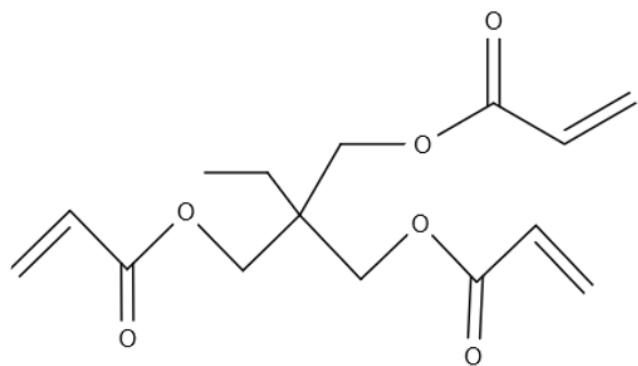

1.3 Cellulose acetate propionate (CAP)

1.4 Polyurethane (PU)

1.5 UV-crosslinked trimethylolpropane triacrylate

2 Pigment used in the printing inks in this study

Pigment Name	CAS Number
PR 57:1	5281-04-9
PR 146	5280-68-2

PY 13	5102-83-0
PBk 7	1333-86-4
PB 15:4	147-14-8

3 Surfactants used for the de-inking experiment in this study

Commercial name or abbreviation	Full name	CAS number
CTAC	Cetrimonium chloride	112-02-7
W111	Oxirane, methyl-, polymer with 151 oxirane, mono(3,5,5-trimethylhexyl) ether	204336-40-3
CTAB	Cetrimonium bromide	57-09-0
Triton X100	Octoxinol 9	9002-93-1

Supplement Material S2:

Program code for color measurement

```
import gradio as gr
import numpy as np
# from matplotlib import pyplot as plt
from skimage import color

# def lab_preview(img_lab):
#     # scale
#     img_lab_scaled = (img_lab + [0, 128, 128]) / [100, 255, 255]
#     # plot
#     fig = plt.figure()
#     plt.subplots_adjust(hspace=0.25)
#     plt.subplot(221)
#     plt.imshow(img_lab_scaled)
#     plt.title('Lab scaled')
#     plt.subplot(222)
#     plt.imshow(img_lab_scaled[:, :, 0], cmap="gray")
#     plt.axis('off')
#     plt.title('L channel')
#     plt.subplot(223)
#     plt.imshow(img_lab_scaled[:, :, 1], cmap='RdYIGn_r')
#     plt.axis('off')
#     plt.title('a')
#     plt.subplot(224)
#     plt.imshow(img_lab_scaled[:, :, 2], cmap='YIGnBu_r')
#     plt.axis('off')
#     plt.title('b')
#     # convert plot to image using buffer
#     fig.canvas.draw()
# 
```

```

# # Now we can save it to a numpy array.

# data = np.frombuffer(fig.canvas.tostring_rgb(), dtype=np.uint8)
# data = data.reshape(fig.canvas.get_width_height()[:-1] + (3,))
# return data

def lab_mean(img_lab):
    return (
        np.mean(img_lab[:, :, 0]),
        np.mean(img_lab[:, :, 1]),
        np.mean(img_lab[:, :, 2])
    )

def process_lab(img):
    img_lab = color.rgb2lab(img)
    # img_pre = lab_preview(img_lab)
    l, a, b = lab_mean(img_lab)
    return l, a, b

demo = gr.Interface(
    fn=process_lab,
    inputs=gr.Image(),
    outputs=[

        gr.Number(label="L-mean"),
        gr.Number(label="a-mean"),
        gr.Number(label="b-mean"),
        # gr.Image(type="pil"),
    ],
)

```

```
if __name__ == "__main__":
    demo.launch()
```
