

SUPPLEMENTARY FIGURE LEGENDS

Supplementary Figure 1. Generation and characterization of iPSCs from adult mouse tail-tip fibroblasts (TTFs). (a) Schematic representation of the experimental design to generate iPSCs. Mouse TTF were transduced one time (day 0 post transduced, 0 DPT) with four PMXs retroviral reprogramming plasmids (Addgene). Six DPT, mouse TTFs were collected and seeded with irradiated MEFs. Mouse TTFs medium was replaced with mouse ESCs medium every day. At 30 DPT, mouse ESC-like colonies were detached from the plate using a rounded tip glass Pasteur pipette, collected and disaggregated manually. (b) Morphology of established iPSC line miPSC-TTF1 at passage number 10. miPSC-TTF1 line was positive for alkaline phosphatase (c) and the pluripotent markers SSEA-1 (d), OCT4 (also known as *Pou5f1*) (d), E-cadherin (e) and SOX2 (e). Nuclei were stained with DAPI (blue). Scale bar (b,d,e): 25 μm , (c): 50 μm . (f) RT-PCR showed miPSC-TTF-1 and miPSC-TTF-2 lines expressed many undifferentiated ESC marker genes. (g-l) Pluripotency of iPSCs derived from adult TTFs *in vitro*. miPSC-TTF-1 colony was harvested by trypsinization and plated on low-attachment plates in the mouse ESC medium without LIF. After 3 days, aggregated cells (g) were transferred onto gelatin-coated tissue culture dishes and incubated for one week (h). Scale bar (g,h): 50 μm . Cells were then fixed and incubated with anti- α -fetoprotein (AFP) (i), anti-brachyury (j) or anti-microtubule-associated protein 2 (MAP2) (k) antibodies. Signals were visualized with Alexa Fluor 488 secondary antibody. Nucleus were stained with DAPI. Scale bar (i-k): 50 μm . (l) We performed RT-PCR with total RNA isolated from EB miPSC (EBmiPSC-TTF-1), EB mouse ESCs, mouse ESCs and MEFs. The expression of Brachyury (mesoderm marker), Gata6 (endoderm marker) and Map2 (ectoderm marker) were examined. Nat1 was used as a loading control.

Supplementary Figure 2. Derivation and characterization of mouse iPSC-NPCs. (a) iPSC-NPCs have elongated bipolar morphology, end-feet and oval nucleus. (b-e) iPSC-NPCs were positive for markers typically observed in authentic NPCs, including nestin, vimentin, musashi and Sox2. (f, g) Some iPSC-NPCs also express the neuron-restricted markers doublecortin (DCX) and MAP2, the astrocyte marker (GFAP) (h) and the oligodendrocyte marker (OLIG1) (i). (j) Pluripotent markers Oct4 and SSEA-1 were silenced in iPSC-NPCs. Scale bar (a-j): 25 μ m. (k) Flow cytometric analysis of iPSC-NPCs showing expression of Nestin, E-Cadherin, DCX, and GFAP, but not Oct4.

Supplementary Figure 3. *In vitro* differentiation of iPSC-NPCs. *In vitro* differentiation showed that iPSC-NPCs were able to generate neurons (a), astrocytes (b) and oligodendrocytes (c) after 3 weeks. Scale bar: 25 μ m

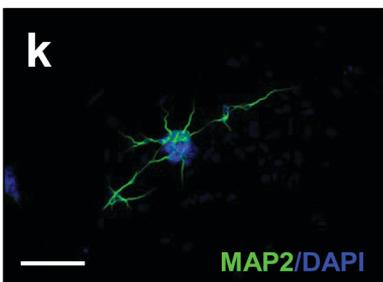

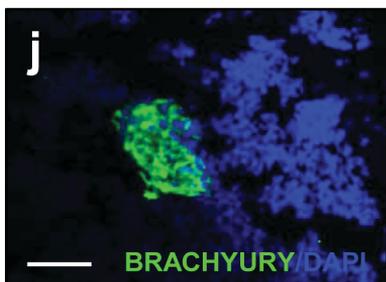

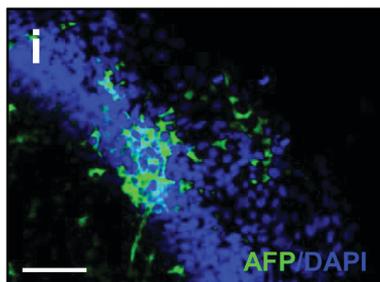

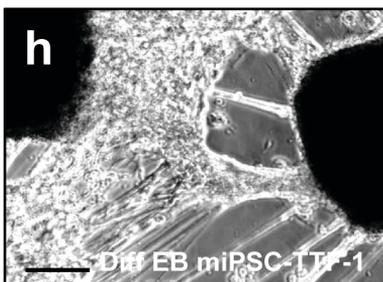

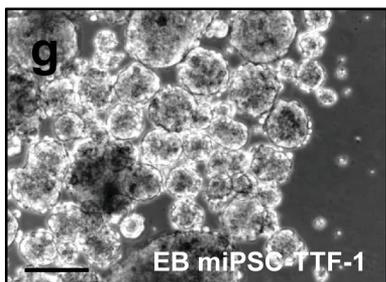

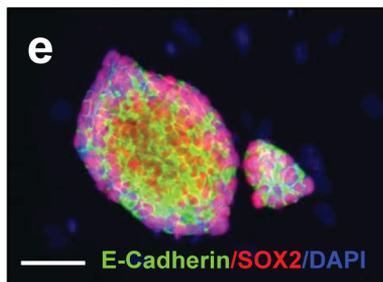

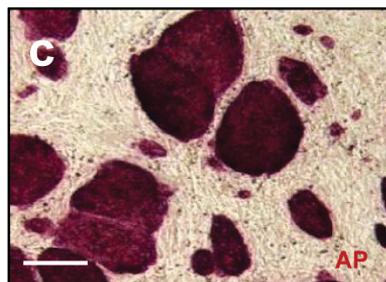

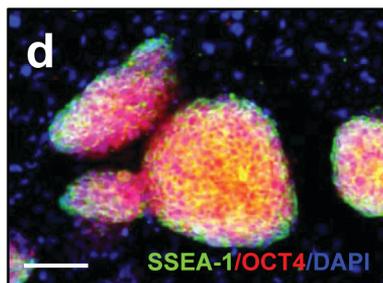

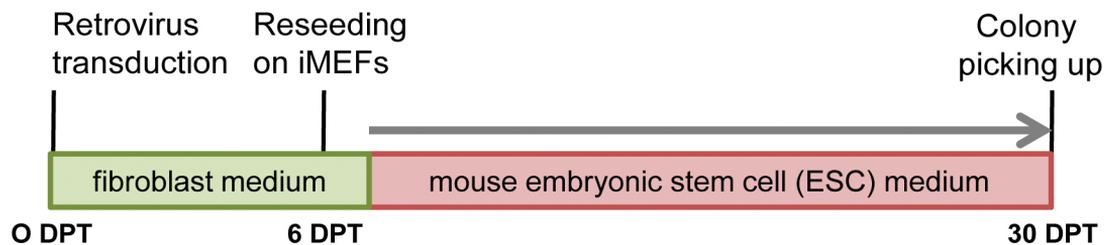

Supplementary Figure 4. Induction of GFP expression in iPSC-NPCs. iPSC-NPCs were transduced with rtTA and Dox-GFP lentivirus. iPSC-NPCs GFP⁺ were then sorted using FACS and expanded. Isolated cells were cultured in the absence (a) or presence (b) of dox (1 g/ml) for 24 h. Dishes were photographed using a fluorescence microscope. CII sortin studies showed that 98.75% of the cells were positive for GFP after dox treatment. Scale bar: 25 μ m

Supplementary Table 1. Primer sequences for mouse ESC genes

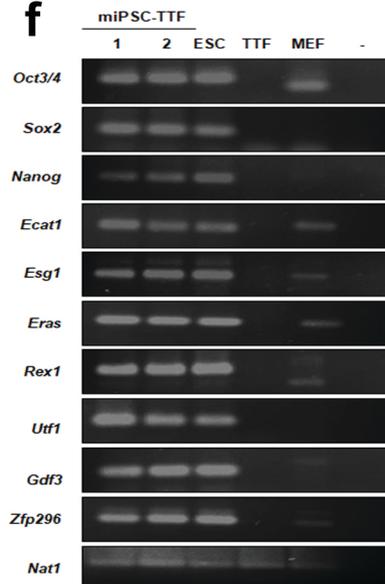

Symbol	Primer sequence 5' to 3'	Gene
Ecat1-RT-S	TGT GGG GCC CTG AAA GGC GAG CTG AGA T	RT-PCR for Ecat1
