## SUPPLEMENTAL MATERIAL

- 1. Overview of literature search parameters.
- 2. Supplementary Table S1. Main astrocytic findings from amyloid-based mouse models.
- 3. Supplementary Table S2. Main astrocytic findings from Tau-based mouse models.
- 4. Supplementary Table S3. Main astrocytic findings from LOAD and LOAD/FAD mouse models
- 5. Supplementary References additional references for material only included in Supplementary Tables 1-3.

## Overview of literature search parameters.

The PubMed search engine (https://pubmed.ncbi.nlm.nih.gov/) was used for the literature search. These keywords were used as Title/Abstract search terms for in all searches: "Alzheimer's" OR "Alzheimer", "astrocytes" OR "astrocyte" OR "astroglia" OR "astrogliosis", "mouse" OR "mice". Additional keywords were used depending on the genetic modification in the mouse models: for APP, "amyloid" OR "amyloid-beta" OR "Abeta" OR "A $\beta$ "; for Tau, "Tau" OR "MAPT"; for ApoE, "ApoE" OR "Apolipoprotein" OR "Apolipoprotein-E"; for TREM2, "TREM2". The literature was restricted to mouse models relevant to the purpose of the review, meaning only studies in transgenic/knock-in mice without additional genetic manipulation other than mutations inducing the AD phenotype in mice. For instance, specific protein KO (such as complement component proteins) studies were excluded as well as studies using drugs. Due to the purpose of the review and limited space models with chemical induction of AD (i.e. heavy metals, okadaic acid) or injection of A $\beta$  or Tau in the mice, namely non-genetically induced AD mouse models, were also excluded. Furthermore, It is important to note that the cited papers could include in vitro work, which were excluded due to the purpose of the review. For acquiring the total number of studies in FAD and LOAD transgenic mouse models, astrocyte-related keywords were removed.

**Supplementary Table S1.** Main astrocytic findings from amyloid-based mouse models. All comparisons are versus age-matched wild-type mice unless otherwise mentioned. Findings included in **Table 1** are not presented in this table. Abbreviations:  $\dagger$  = upregulation;  $\downarrow$  = downregulation; NC = no significant change; ? = contradicting data \* = missing data; A $\beta$  = Amyloid Beta, APP = Amyloid Precursor Protein, BS = Brain Stem, CB = Cerebellum, CA = cornu ammonis, CTX = Cortex, DG = Dentate Gyrus, EC = Entorhinal Cortex, ELISA = Enzyme-linked Immunosorbent Assay, EtBr = Ethidium Bromide, FACS = Fluorescence-activated Cell Sorter, FLIM = Fluorescence Lifetime Imaging Microscopy, FRAP = Fluorescence Recovery after Photobleaching, FtC = Frontal Cortex, GJ = Gap Junctions, HPC = Hippocampus, IHC = Immunohistochemistry, ISH = *In Situ* Hybridization, iTRAQ = Isobaric Tags for Relative and Absolute Quantitation, LM = Laconosum Moleculare, MX04 = Methoxy-X04, mo = months old, ParC = Parietal Cortex, PET = Positron Emission Tomography, qPCR = Quantitative Polymerase Chain Reaction, RGCL = Retinal Ganglion Cell Layer, SC = Spinal Cord, SO = Stratum Oriens, SP = Stratum Pyramidale, SR = Stratum Radiatum, STR = Striatum, TH = Thalamus, Tg = Transgenic mice, vs = versus (comparison), WB = Western Blot, WT = Wild Type, YFP = Yellow Fluorescent Protein, [Ca<sup>2+</sup>]<sub>i</sub> = intracellular calcium concentration, ([<sup>11</sup>C]DED = 11C-Deuterium-l-Deprenyl). For additional synonyms for individual mouse models we recommend referring to www.informatics.jax.org.
