

Figure S1: Cumulative distributions of total shoot dried weight (ShDW), and changes in ShDW (dShDW), ShFW (dShFW), ShWp (dShWp) and ShWC (dShWC). The position of Bol (black line) and Bol/Bol (red line) are indicated.

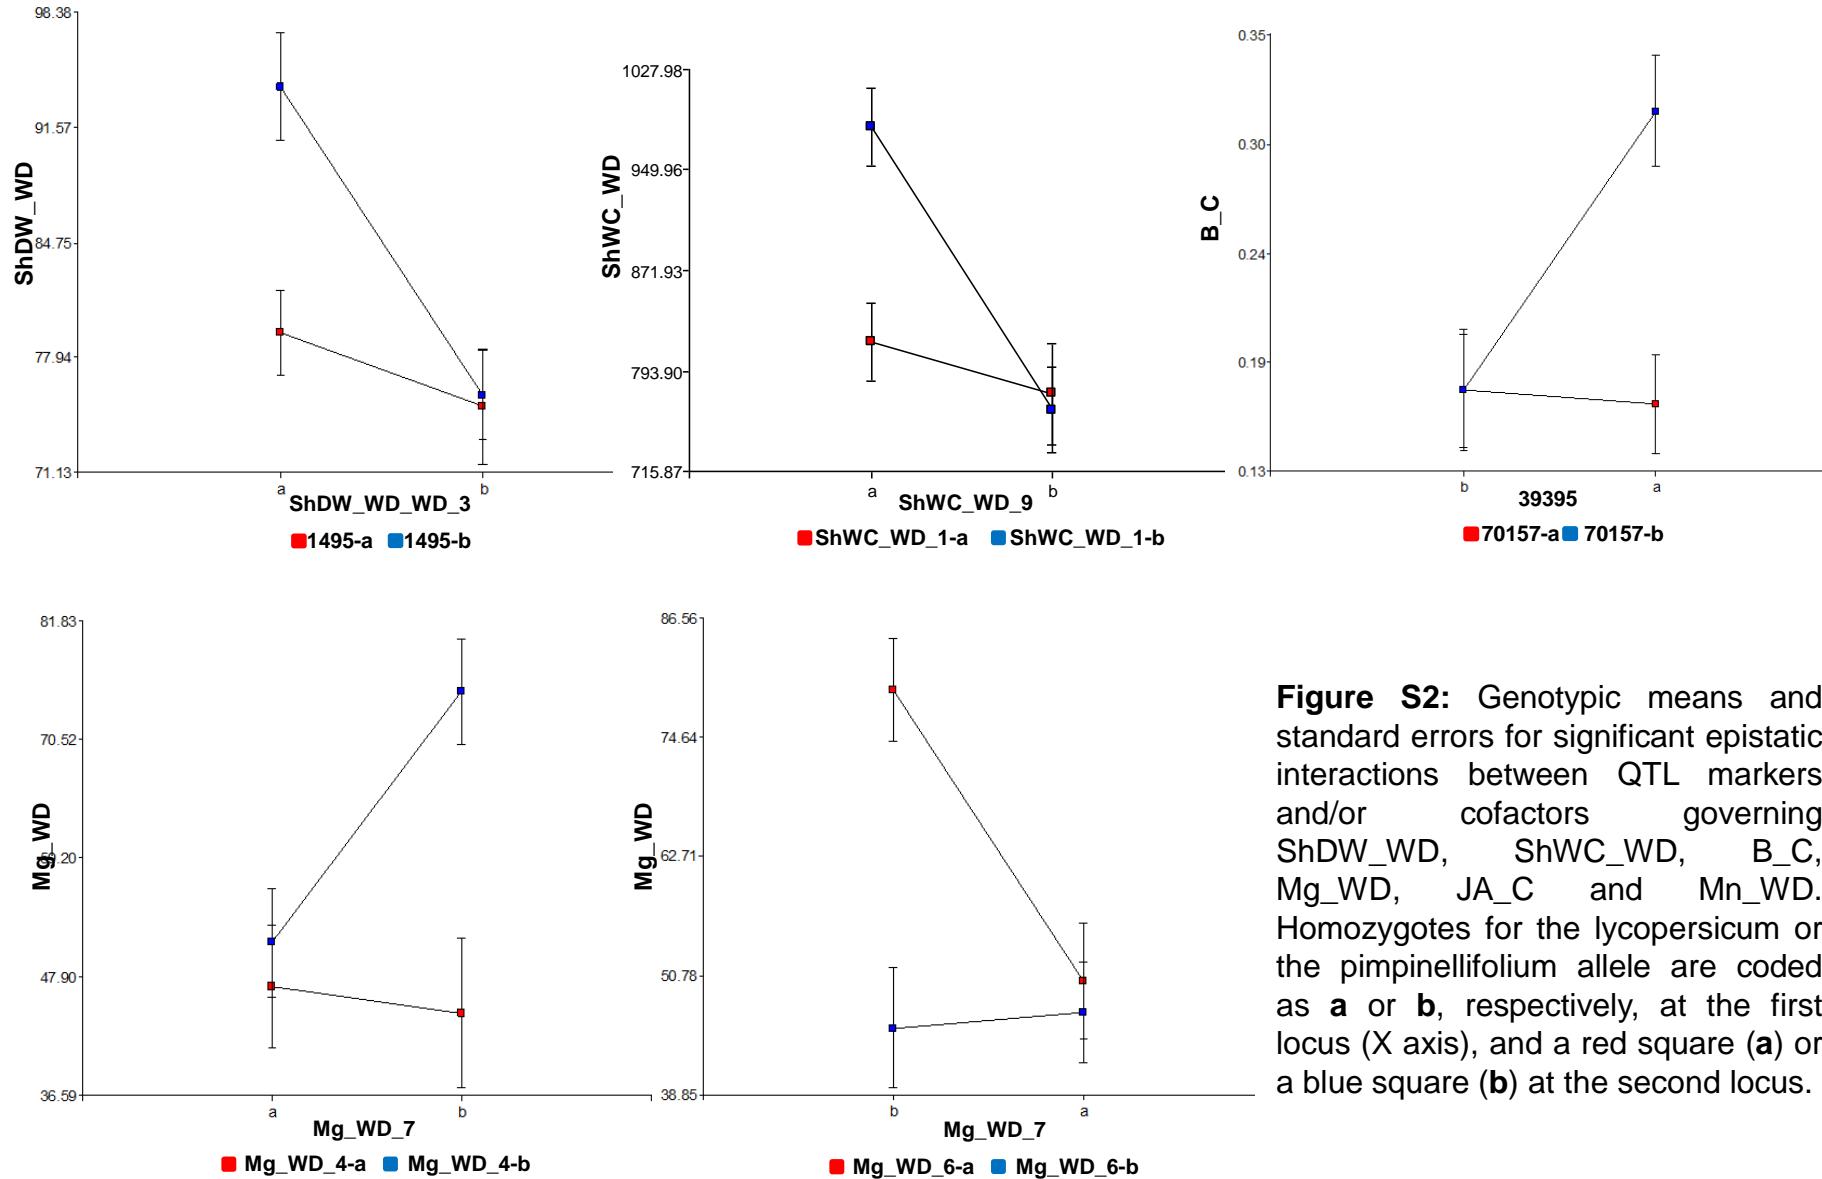

Figure S2: Genotypic means and standard errors for significant epistatic interactions between QTL markers and/or cofactors governing ShDW_WD, ShWC_WD, B_C, Mg_WD, JA_C and Mn_WD. Homozygotes for the lycopersicum or the pimpinellifolium allele are coded as **a** or **b**, respectively, at the first locus (X axis), and a red square (**a**) or a blue square (**b**) at the second locus.

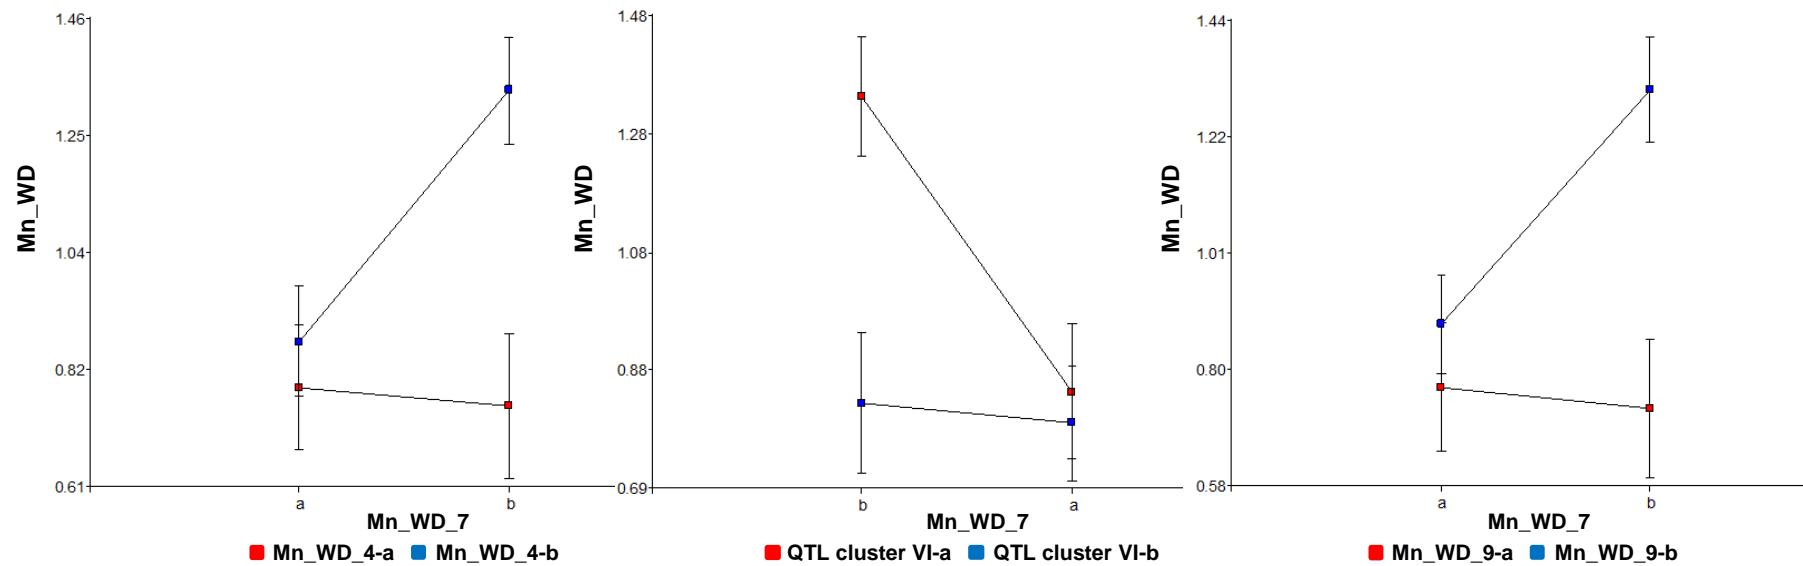

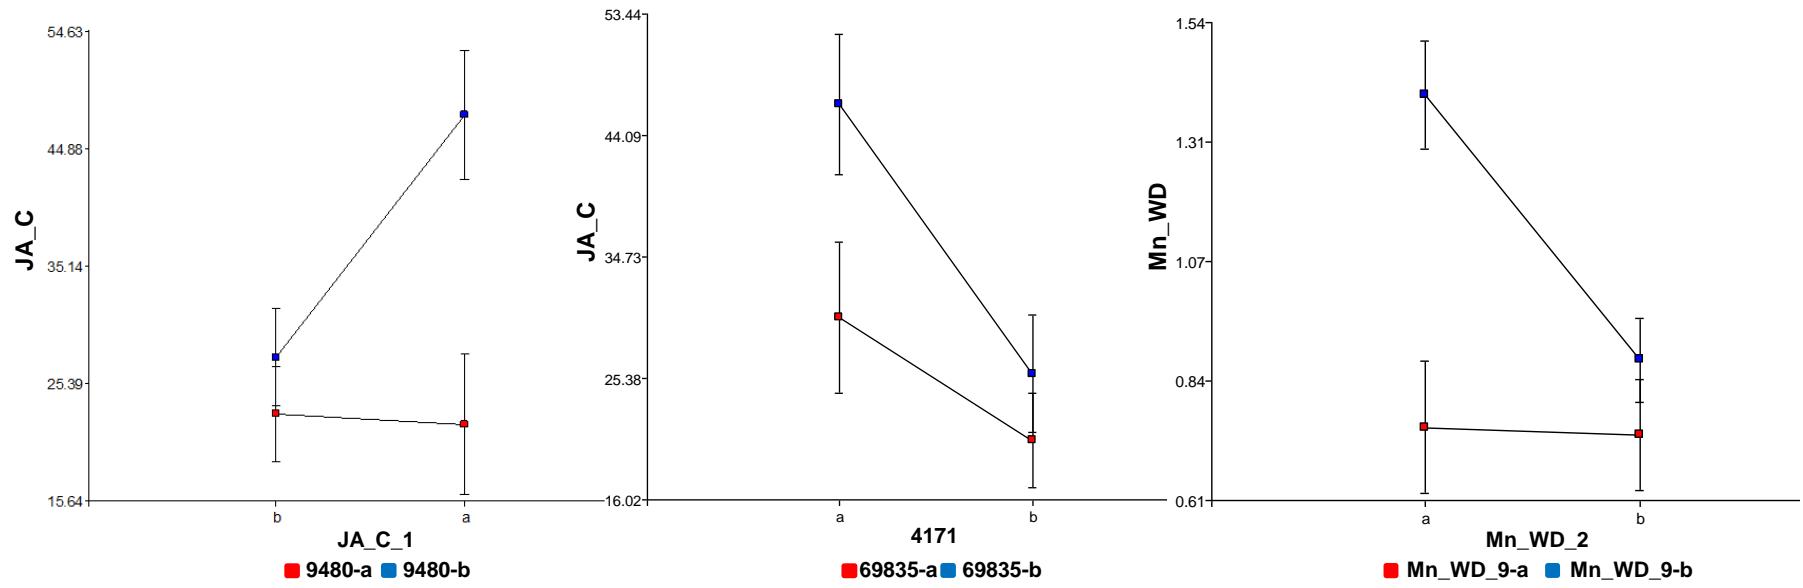

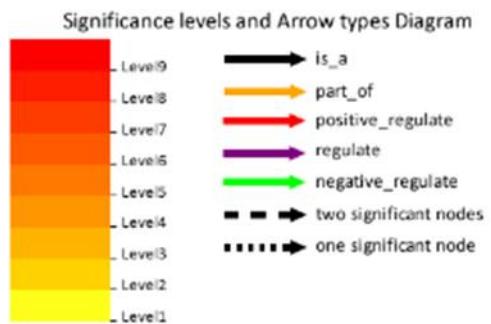

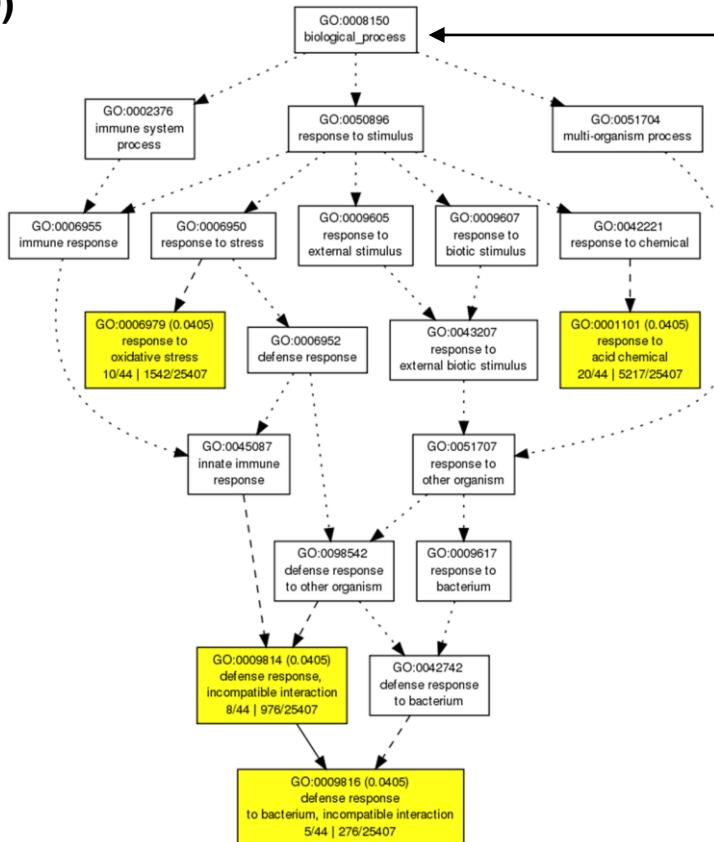

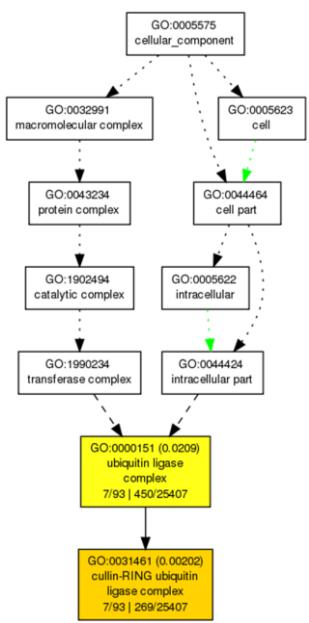

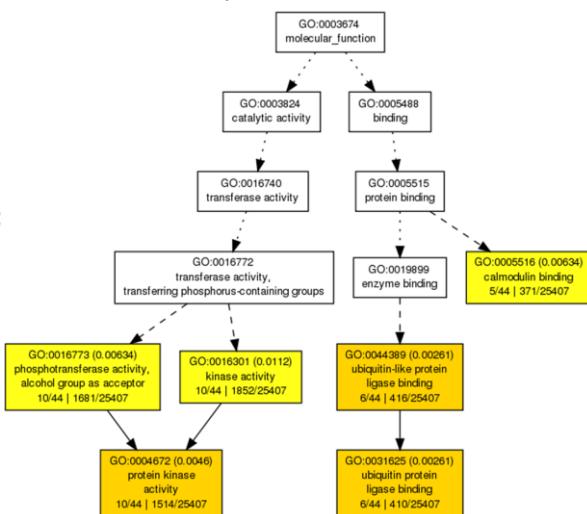

Figure S3: Overrepresented Biological Processes, Molecular Functions and Cellular Components within clustered QTL genomic regions using the Singular Enrichment Analysis tool with the Fisher's Exact with FDR multiple test correction [49] at the AgriGo platform (<http://systemsbiology.cau.edu.cn/agriGOv2/>).

Table S5: Summary list of candidate genes in drought tolerance QTL clusters, some segregating for frameshift Indels [48] in parental genomes, E9 or L5, (Mut.). The mRNA reference, its starting physical position in the chromosome (Start), its relative root expression (Exp.) in Heinz cultivar (Max: maximum, H: high, M: medium, VL: very low, L: low and N: no data), and the number of genes counted from the QTL peak (Ord.) are also shown.
