Figure S1. Location and extent of CRU cells considered for each study catchment.

Table S1. Base case and alternative (Alt.) quantification scenarios and their variations for different catchments.

Table S2. Freshwater changes and main uncertainty estimates for the Mainland catchment.

Table S3. Freshwater changes and main uncertainty estimates for the Peloponnese catchment.

Table S4. Freshwater changes and main uncertainty estimates for the Ionian catchment.

Table S5. Freshwater changes and main uncertainty estimates for the Aegean catchment.

Table S6. Evapotranspiration conditions and changes showing insignificant influence of choice of ET/P scenario (defined in main Table 3) for the example of the total regional catchment.

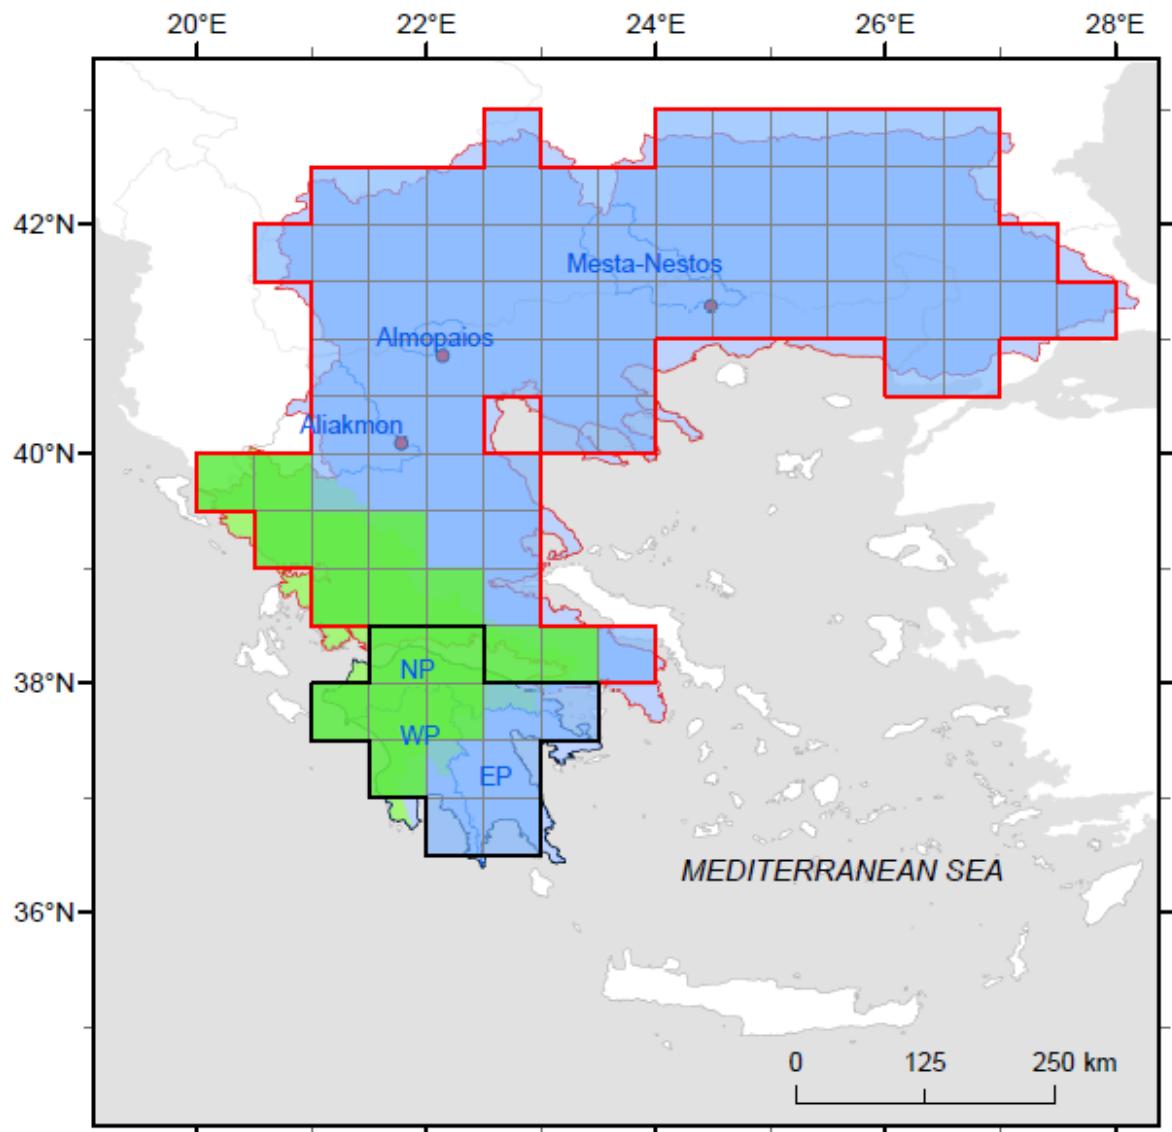

Figure S1. Location and extent of CRU cells considered for each study catchment: total regional catchment (colored), Mainland (red outline), Peloponnese (black outline), Ionian (green) and Aegean (blue).

Table S1. Base case and alternative (Alt.) quantification scenarios and their variations for different catchments. The scenario definitions (Base, Alt.) are as given and explained in main Table 3 for the total regional catchment. The terms P , ET , Iww , αirr and Per represent precipitation, evapotranspiration, irrigation water withdrawal per irrigated area, ratio $Aai/Aa2$ between irrigated area (Aai), and time period. The latter is period 1 (1930-1949) or period 2 (1990-2009).

Scenario	Mainland		Peloponnes		Ionian		Aegean	
	Per1	Per2	Per1	Per2	Per1	Per2	Per1	Per2
Base P (mm/yr)	663	622	773	693	861	767	637	602
