Supplementary Material

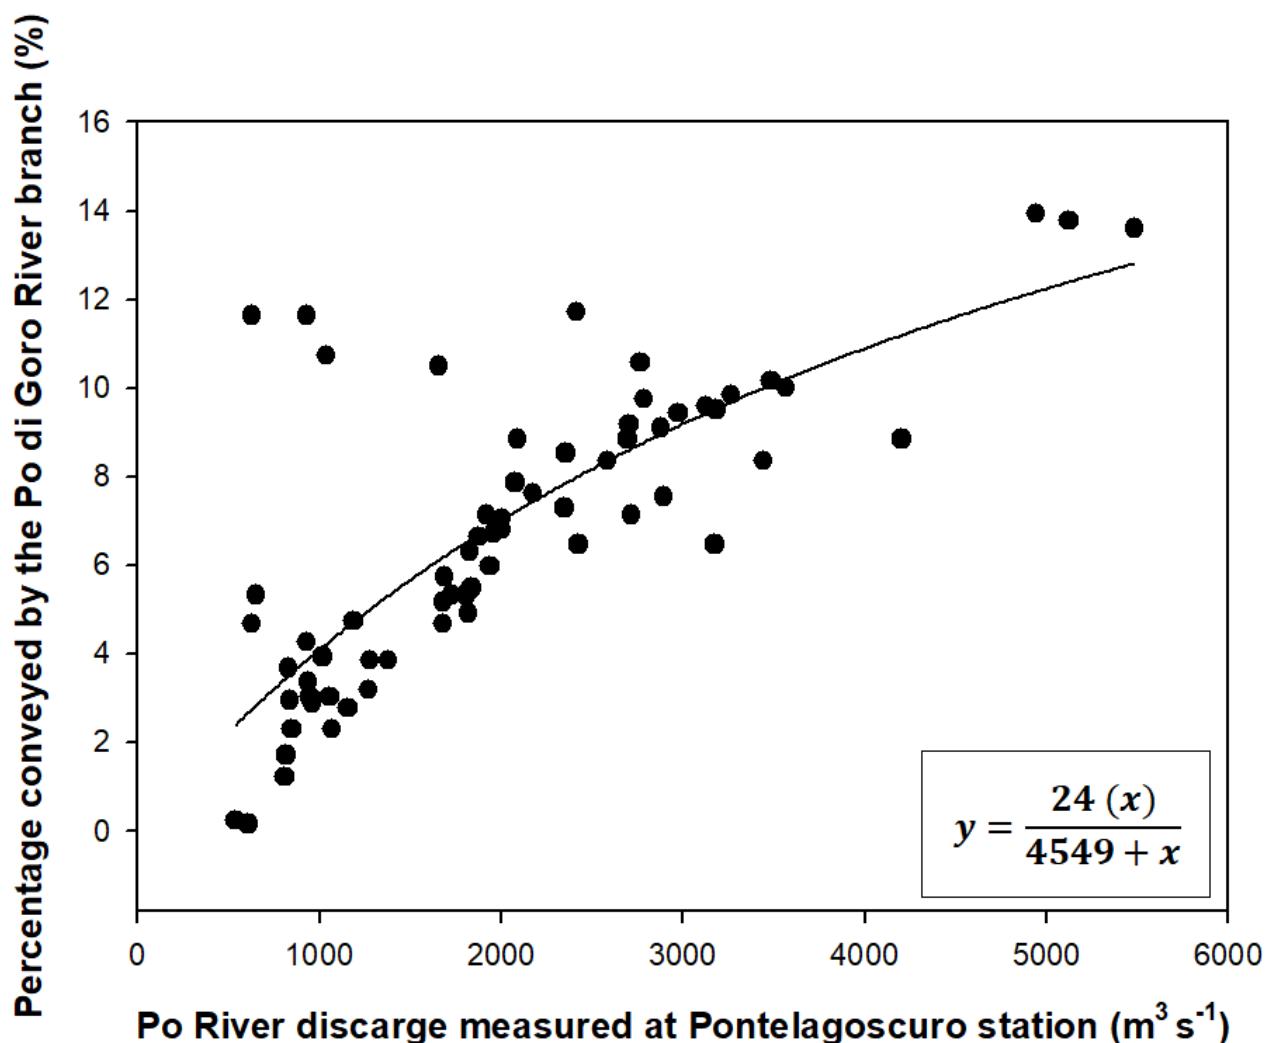

Figure S1: Relation between the Po River discharge measured at Pontelagoscuro station and the percentage conveyed by the Po di Goro branch (data from [1]).

Table S1: Total denitrification rates measured via Isotope Pairing Technique in different aquatic ecosystems of the Po River basin during the period of the highest temperature of the year (CW, connected wetlands; IW, isolated wetlands; R, rivers; LK, lakes; LG, lagoons). Main sediment and water features are reported for comparison. SOD and Dtot are expressed as average values with associated standard deviation (in brackets).
