

Supplement1: RPM and Century model inputs

Data sources from which model inputs were obtained are listed in Table 1. Because RPM was adapted from the Century model, the two models share many required inputs. RPM is a gridded or raster-based model and many of the required inputs are also raster-based. For Century simulations, which are point-based, input values were taken from the same data sources by taking the value from the pixel containing the simulation location.

Table 1. Input data sources and values for RPM and Century model runs.

Input	Source
Soil variables	ISRIC SoilGrids 250m, version 2.0, available from soilgrids.org
Monthly average minimum/maximum daily temperature	Historical average annual monthly minimum and maximum temperature for the period 1970-2000, version 2.0, available from worldclim.org
Monthly precipitation	Historical average annual monthly precipitation for the period 1970-2000, version 2.0, available from worldclim.org
Site parameters	See Table 2.
Plant functional type parameters	See Table 2.
Animal parameters	See Table 2.
Management threshold	100 kg/ha
Crude protein concentration of forage	14.70%
Grazing animal density (fifteen sites across precipitation gradient)	Empirical dung counts (see main text for methodology)
Grazing animal density (Gobi-Steppe ecoregion simulation)	Total number of livestock in each soum in 2018, available from 1212.mn. Converted to Sheep Forage Units following [1]

Table 2. Animal, site, and plant functional type parameters. Birth weight, standard reference weight, and standard fleece weight from [2]. Impacts of grazing on vegetation growth from the “grazing-tolerant” population described by [3]. Parameters for temperate C3 grassland in Tuva, Russia, described by [4] were calibrated via comparison to biomass data collected in Mongolia. See “Calibration of RPM and Century” for calibration methods. See RPM documentation, Appendix 1, for parameter definitions.
