**Supplementary Table S3. Parameters of RNNSurv**

Time-varying predictors (m1-dimension; 2-time steps)	Invariant predictors (m2-dimension)
Recurrent neural network (RNN) layer (input_size = m1, hidden_size = m1, num_layers = 1, batch_first = True)	Fully connected (FC) layer (in_features = m2, out_features = 16) ReLU activation function, BatchNorm1d(num_features = 16) Droup(p = 0.5)
FC layer(in_features = m1, out_features = m1) ReLU activation function, BatchNorm1d(num_features = m1) Droup(p = 0.5)	
Concentrate	
FC layer(in_features = m1 + 16, out_features = 1) Linear activation function	

Due to back elimination, the number of predictors (m1, m2) would change, therefore, the parameter values in RNNSurv would change as well. Then the model would be fixed once back elimination was done. Model was developed by PyTorch 1.5.0 (Curran Associates, Inc.).
