

## SUPPLEMENTARY MATERIAL

**Table S1. Flow rates and bases/references**

Component	Interaction	Flow Rate	Explanation	Basis/Reference
 <p style="text-align: center;">Potato Reproduction</p>	Health_of_Potato → Potato_Rep	1.00	Reproductive capacity of the potato plant is expected to be most highly influenced by its overall health.	Assumed
	Vegetative_Rep → Potato_Rep	1.00	Maximal vegetative reproductive rate of the potato plant is expected to result to maximal reproduction of potato	Assumed
	Potato_Rep → Underground_Bud	1.00	Reproduction in potato involves production of underground buds.	Assumed
	Potato_Rep → Foliage	1.00	Reproduction in potato involves maintenance of foliage.	Assumed
 <p style="text-align: center;">Tuberization</p>	Underground_Bud → Tuberization	1.00	The underground bud undergoes tuberization to form tubers for vegetative reproduction.	Assumed
	Tuberization → Vegetative_Rep	1.00	Maximal tuberization rate results to maximal vegetative reproductive rate of the potato plant.	Assumed
	Tuberization → Tuber	1.00	Maximal tuberization rate results to maximal consumable potato tuber production.	Assumed
 <p style="text-align: center;"><i>Leptinotarsa decemlineata</i> Infestation</p>	L_decemlineata_Pop → Infestation	1.00	Population establishment of <i>L. decemlineata</i> leads to infestation on the potato plant.	Assumed
	Health_of_Potato → Infestation	0.80	Maximum yield loss of 80% in potato can be caused by an infestation of <i>L. decemlineata</i> when control measures are not implemented.	Maharijaya & Vosman [25]
	Infestation → Level_of_infestation	1.00	The observable level of infestation of <i>L. decemlineata</i> on the potato plant is expected to be a function of the infestation capacity of the pest.	Assumed

 <p>Establishment of Invading <i>L. decemlineata</i></p>	Foliage → L_decemlineata_Est	0.08	Establishment of invading <i>L. decemlineata</i> is estimated to require at least 8 percent of the foliage of the potato plant, or about one-third of 25% which is the reported defoliation threshold that can be tolerated by the potato plant.	Varenhorst <i>et al.</i> [26]; Ragsdale & Radcliffe [27]; assumed
	L_decemlineata_Est → CPB_eggs	1.00	Oviposition would result from the establishment of the invading <i>L. decemlineata</i> .	Assumed
 <p>Hatching of CPB Eggs</p>	CPB_eggs → Hatching	1.00	<i>L. decemlineata</i> eggs will undergo hatching.	Assumed
	Hatching → CPB_larvae	1.00	Hatching of the CPB eggs will produce larvae.	Assumed
 <p>Pupation of CPB Larvae</p>	Foliage → Pupation	0.08	Pupation of <i>L. decemlineata</i> larvae is estimated to require at least 8 percent of the foliage of the potato plant, or about one-third of 25% which is the reported defoliation threshold that can be tolerated by the potato plant.	Varenhorst <i>et al.</i> [26]; Ragsdale & Radcliffe [27]; assumed
	CPB_larvae → Pupation	1.00	CPB larvae will undergo pupation.	Assumed
	Pupation → CPB_pupae	1.00	Pupation of larvae will produce CPB pupae.	Assumed

 <p>Eclosion of CPB Pupae</p>	CPB_pupae → Pupation	1.00	CPB pupae will undergo eclosion.	Assumed
	Pupation → CPB_pupae	1.00	Eclosion of pupae will produce CPB adults.	Assumed
 <p>Reproduction of CPB</p>	Foliage → L_decemlineata_Rep	0.08	Reproduction by <i>L. decemlineata</i> adults is estimated to require at least 8 percent of the foliage of the potato plant, or about one-third of 25% which is the reported defoliation threshold that can be tolerated by the potato plant.	Varenhorst <i>et al.</i> [26]; Ragsdale & Radcliffe [27]; assumed
	CPB_adults → L_decemlineata_Rep	1.00	CPB adults will mate and reproduce.	Assumed
	L_decemlineata_Rep → L_decemlineata_Pop	1.00	Maximal reproductive capacity of <i>L. decemlineata</i> leads to further population establishment of CPB on the host potato plant.	Assumed
 <p>Reproduction of <i>Edovum puttleri</i></p>	CPB_eggs → E_puttleri_Rep	0.90	Average mortality of 90% in CPB egg masses resulting from parasitism or probing by <i>E. puttleri</i>	Lashomb <i>et al.</i> [21]
	Health_of_E_puttleri → E_puttleri_Rep	1.00	Maximum reproductive capacity of <i>E. puttleri</i> would require healthy parasitoids that can effectively search for and parasitize CPB eggs	Assumed
	E_puttleri_Rep → E_puttleri_Pop	1.00	Maximal reproductive capacity of <i>E. puttleri</i> leads to population establishment on the CPB-infested potato plant.	Assumed
	E_puttleri_Rep → Control	1.00	<i>E. puttleri</i> parasitism (reproduction) renders biological control of CPB.	Lashomb <i>et al.</i> [21]; assumed

 <p>Reproduction of <i>Oplomus dichrous</i></p>	CPB_eggs → O_dichrous_Rep	0.14	95% overall CPB mortality x 14% CPB egg mortality resulting from the consumption by <i>O. dichrous</i> across developmental stages of the CPB	Drummond <i>et al.</i> [22]; assumed
	Health_of_O_dichrous → O_dichrous_Rep	1.00	Maximum reproductive capacity of <i>O. dichrous</i> would require healthy bugs that can effectively search for and prey on CPB eggs, larvae, and adults.	Assumed
	Health_of_L_decemli neata → O_dichrous_Rep	0.019	Consumption rate of <i>O. dichrous</i> on the invading adult CPB at 95% overall CPB mortality x 2% adult CPB mortality resulting from the consumption by <i>O. dichrous</i> across developmental stages of the CPB	Drummond <i>et al.</i> [22]; assumed
	CPB_larvae → O_dichrous_Rep	0.792	95% overall CPB mortality x 83.4% larval mortality CPB resulting from the consumption by <i>O. dichrous</i> across developmental stages of the CPB	Drummond <i>et al.</i> [22]; assumed
	CPB_adults → O_dichrous_Rep	0.019	95% overall CPB mortality x 2% adult CPB mortality resulting from the consumption by <i>O. dichrous</i> across developmental stages of the CPB	Drummond <i>et al.</i> [22]; assumed
	O_dichrous_Rep → O_dichrous_Pop	1.00	Maximal reproductive capacity of <i>O. dichrous</i> leads to population establishment on the CPB-infested potato plant.	Assumed
	O_dichrous_Rep → Control	1.00	<i>O. dichrous</i> predation (reproduction) renders biological control of CPB.	Drummond <i>et al.</i> [22]; assumed
 <p>Chemical Pest Control</p>	Pesticide → Chemical_Dosing	1.00	Chemical insecticides, particularly neonicotinoids such as thiamethoxam, have been used for control of CPB.	Scott <i>et al.</i> [23]
	Chemical_Dosing → Control	1.00	Neonicotinoid insecticide thiamethoxam renders population control of target and non-target insects.	Assumed
	Health_of_E_puttleri → Chemical_Dosing	0.99	<i>E. puttleri</i> , a parasitic hymenopteran, would be most likely as highly susceptible to neonicotinoid toxicity similar to how it was for other parasitic wasps such as <i>Comperiella calauanica</i> .	Almarinez <i>et al.</i> unpublished data on neonicotinoid toxicity in <i>C. calauanica</i>

	Health_of_O_dichrous → Chemical_Dosing	0.868	<i>O. dichrous</i> could exhibit susceptibility to thiamethoxam toxicity as <i>Podisus nigrispinus</i> , another predatory pentatomid, when exposed to treated plants or fed with treated prey.	Torres <i>et al.</i> [24]
	Health_of_L_decemli neata → Chemical Dosing	0.77	Mean thiamethoxam-induced mortality of CPB in 2011 in Canada	Scott <i>et al.</i> [23]
