

## Supplementary materials

Table S1. Crop rotation history under conventional and conservation tillage practices.

Year	Conventional tillage (CT)					Conservation strip tillage (ST)				
2012-13	Wheat	Barley	Oats	OSR	Wheat	Wheat	Barley	Oats	OSR	Wheat
2013-14	Barley	OSR	Wheat	Wheat	Wheat	Barley	OSR	Wheat	Wheat	Wheat
2014-15	OSR	Wheat	Barley	Oats	Wheat	OSR	Wheat	Barley	Oats	Wheat
2015-16	Wheat	Oats	OSR	Wheat	Wheat	Wheat	Oats	OSR	Wheat	Wheat

\*Samples collected in year 2014-15 and 2015-16 were highlighted with orange colour. The text highlighted with bold letters describe the OSR and wheat samples collected for analysis in each year and show previous crop history..

Table S2. Crop management practices used for the wheat and OSR winter crops.

Crops Name	Variety	Sowing date	Harvest date	Seed rate Seeds /m <sup>2</sup>	Fertilizer application kg/ha			Fungicide application	Herbicide application	Insecticide application
					N	P	K			
OSR	Com-pass	2/9/14	27/7/15	14/15 50	225	25.2	108	Proline 0.4 L/ha (in year 2014/15) & 0.6 L/ha (in year 205/16) for Light leaf spot, Filan 0.5 kg/ha for Phoma stem canker	Katamaran 2L/ha (Pre-sowing), Falcon 1L/ha (Post-sowing)	Slug pellets 5kg /ha (in year 204/15) & 4 kg/ha (in year 205/16)
		9/9/15	25/7/16	15/16 60						Sumi Alpha for Flea Beetle
30/9/14 25/8/15								Caldrum + Bravo (2.5 +1 L/ha), Adexar + Bravo (1.6 + 1 L/ha), Prosaro 1 L/ha for Septoria disease	Roundup 0.4 L/ha (Pre-sowing), Alister 1 L/ha (Post-sowing), Pacifica 0.5 kg/ha	Sumi Alpha for Aphids
Wheat (R) Wheat (M)	J B Diego	30/9/15	27/8/16	300	225	25.2	108			

\*(R) means wheat in rotation where the previous crop was OSR and (M) means continuously growing wheat or wheat monoculture where previous crop was wheat.

Table S3. Physical and chemical characterisation of the soil substrates.

Mineral content (g·kg <sup>-1</sup> )	Rotation CT		Rotation ST		Monoculture CT	Monoculture ST
	Total carbon	Total nitrogen	Soil organic matter	Soil organic carbon		
Total carbon	3.83	0.27	6.70	2.74	3.87	3.72
Total nitrogen	0.27	0.27	6.82	2.77	0.27	0.26
Soil organic matter	6.70	6.82	6.67	6.69		
Soil organic carbon	2.74	2.77	2.71	2.71		
C/N ratio	12.87	13.12	12.45	12.46		
pH	6.52	7.12	6.80	7.05		
Soil classification	Sandy clay loam					

\*Rotation = OSR and wheat crops were grown in rotation. Monoculture = wheat was continuously grown in the same plot under CT and ST practices.

Table S4. Climate and weather conditions during the experiment.

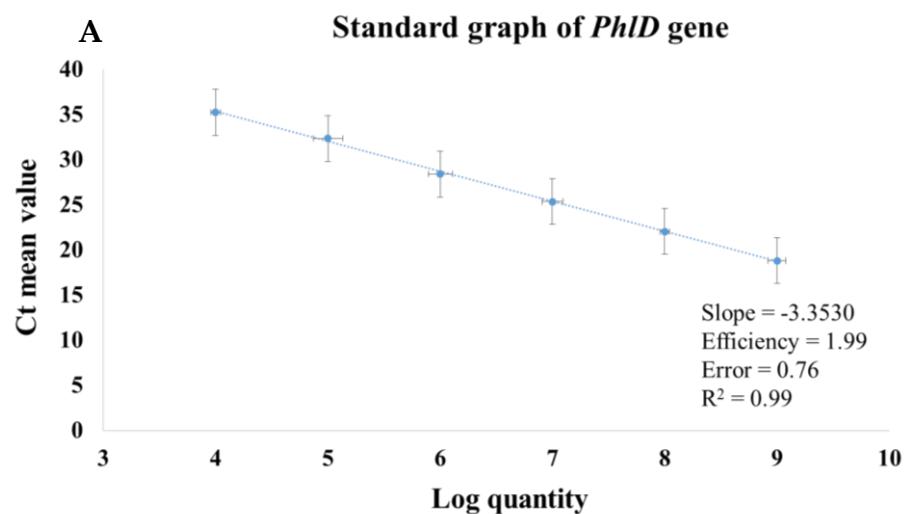

Months	Max air temp °C	Min air temp °C	Mean air temp °C	Total rainfall (mm)	Mean wind Speed (ms <sup>-1</sup> )	Max wind speed (ms <sup>-1</sup> )	Solar radiation (Wm <sup>-2</sup> )	Humidity (%)	CBL pressure (Pa)	Soil temperature °C at			
	High	Low	Low High		(ms <sup>-1</sup> )	(ms <sup>-1</sup> )				5cm	10cm	20cm	30cm

\*Parameters were recorded for example; temperature in degree Celsius, rainfall in millimetres, wind speed in meters per second, humidity in percentage, Convective Boundary Layer (CBL) atmospheric pressure in Pascal (Pa), and solar radiation in Watt per square meter. OSR and wheat crops were sown in month of September and harvested in July and August respectively. Maximum and minimum air temperatures were reported from the range of high to low.

**Figure S1.** Standard curve was generated using 10-fold dilution of the bacterial DNA from *P. fluorescens* strain F113. Each dilution was analysed in triplicate. **A**, Standard curve with the Ct plotted against the log of the starting quantity of DNA for each dilution. **B**, Amplification curves of the dilution series. **C**, Melting pick of each dilution. **D**, PCR amplification on agarose gel of each dilution, positive, negative and water control in triplicate. (P) positive control *P. fluorescens* F113 DNA, (N) negative control *E.coli* DNA.

**Table S5.** Ct value and associated calculations for *PhID* gene copy number per gram of rhizosphere soil sample from year 2014/15.

Calculating copy number (CN) g-1 of soil and g-1 of root samples following qPCR

Sample concentration was determined following amplification cycle. The standard curve was developed in order to calculate the gene CN of 10 µL reaction of each dilution. The mean Ct value of each unknown sample was calculated using the equation line of the standard curve to get the estimated log value. The concentration was then back calculated to determine the CN g-1 of the original soil or root sample. The concentration of each DNA sample (both soil and root) was normalised to 10 ng µL-1, and in each 10 µL reaction mixture 1 µL normalised DNA was used. Further information on these calculations are described here:

Example calculation for soil:

$$\text{CN g-1 of soil} = ((\text{Calculated CN} \times \text{Original DNA concentration} \times \text{dilution factor}) / 10) \times 4$$

DNA concentration used for the reaction

The calculated CN from the Ct value of the sample was 549

Original DNA concentration of the sample was 86 ng µL-1

DNA was dissolved in 50 µL H2O

DNA concentration used for the each reaction was 10 ng µL-1

Soil used for the DNA extraction was 0.25 g

$$\text{CN g-1 of soil} = ((549 \times 86 \times 50) / 10) \times 4 = 944,280 \text{ copies per g soil}$$

Example calculation for root:

$$\text{CN g-1 of root} = (\text{Calculated CN} \times \text{Original DNA concentration} \times \text{dilution factor}) \times 2$$

DNA concentration used for the reaction

The calculated CN from the Ct value of the sample was 549

Original DNA concentration of the sample was 108 ng µL-1

DNA was dissolved in 50  $\mu$ L H<sub>2</sub>O

DNA concentration used for each reaction was 10 ng  $\mu$ L<sup>-1</sup>

Root sample used for the DNA extraction was 0.50 g

CN g<sup>-1</sup> of root = (549 X 108 X 50) X 2 = 5929
