Figure S1. Light microscopy micrographs of LLC-PK1 (A) and PK-15 cells (B). Pictures were taken from cells of passage 12 at approximate 80% confluence of LLC-PK1 (A) and approximate 95% confluence of PK-15 cells (B). Original magnification x10.

Figure S2. Orcinol stain (A) and antibody-mediated immunochemical detection of TLC-separated globo-series GSLs Gb3Cer (B) and Gb4Cer (C) in the neutral GSL preparations of the second biological replicate of the porcine LLC-PK1 and PK-15 renal epithelial cell line. The applied GSL quantities correspond to 2×10^6 LLC-PK1 and 1×10^6 PK-15 cells for the orcinol stain (A) and to 5×10^5 LLC-PK1 and PK-15 cells for the anti-Gb3Cer (B) and anti-Gb4Cer overlay assay (C). R1: 20 μg (A), 2 μg (B), and 0.2 μg (C) of neutral GSLs from human erythrocytes served as reference.

Figure S3. Detection of Stx-binding GSLs in the neutral GSL preparations of the second biological replicate of the porcine LLC-PK1 and PK-15 renal epithelial cell line. (A-D) Stx1a and Stx2a subtypes originated from human EHEC isolates. The two Stx2e variants are of different origin: Stx2e(h) derived from a human and Stx2(p) from a porcine STEC isolate. Applied GSL amounts correspond to 2×10^6 cells for the Stx overlay assays. R2: 20 μ g and 2.4 μ g of an equimolar mixture of Gb3Cer and Gb4Cer served as reference for the orcinol (Orc) stains and the Stx overlay assays, respectively.
