<sup>1</sup>the relative abundances (%) were calculated based on the differentiation information obtained by Random Amplification of Polymorphic DNA (RAPD) and 16S rRNA gene sequencing; the isolates within each RAPD cluster were considered to belong to the same genus of the isolate(s) within that cluster that was(were) subject to molecular identification; calculations were made by dividing the number of differentiated strains within each cluster by the total number of differentiated strains using RAPD.

<sup>2</sup>the relative abundances (%) were calculated based on the taxonomical classification of OTU and the total number of obtained OTU reads.

<sup>3</sup>taxon representativity was based on the relative abundance of groups (%).

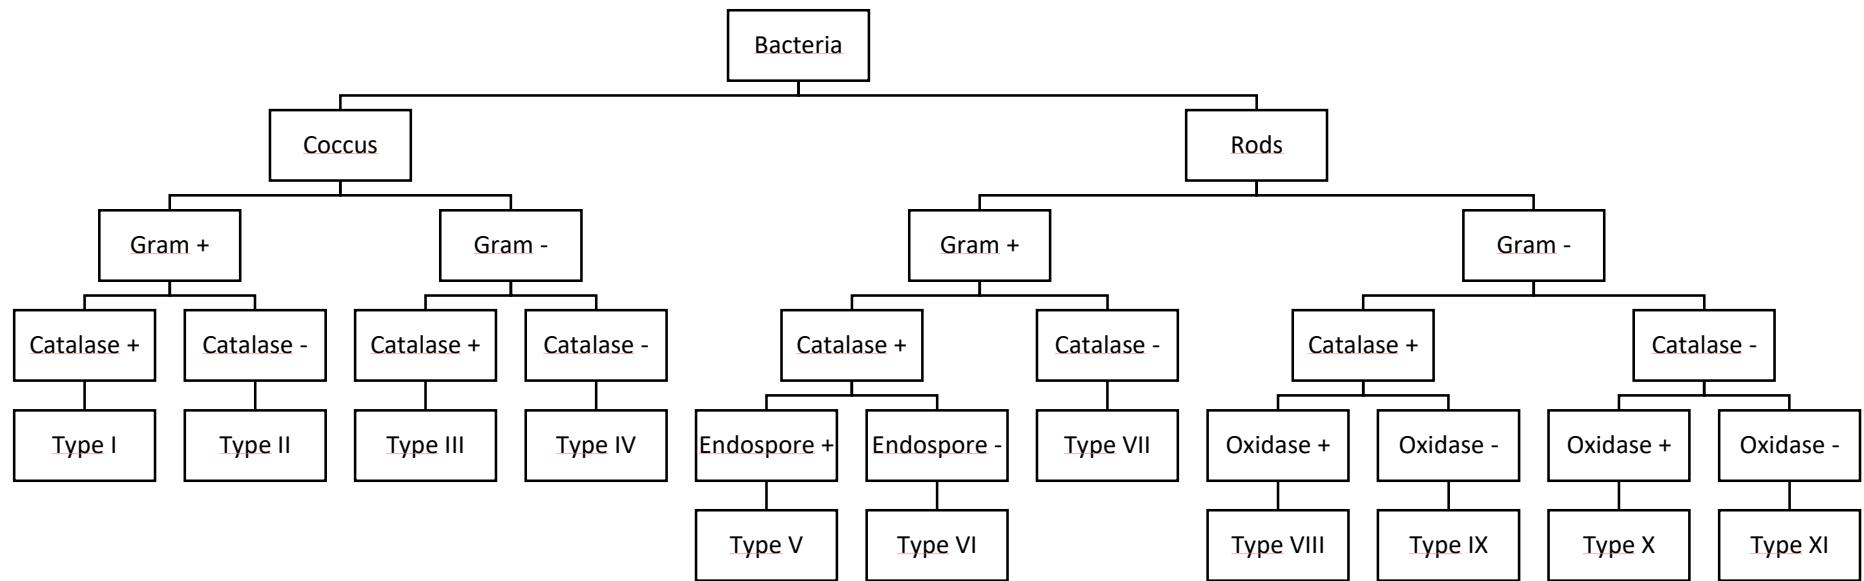

Supplementary Table 3 – Information on the ITS nucleotide sequences of a selected group of fungi isolates.

Isolate	Animal	Phenotypic Identification <sup>1</sup>	Nucleotide Sequence Length	Closest Reference Sequence Match	Query cover	E-value	Nucleotide Sequence Identity	Accession Number	Assigned Phylotype <sup>2</sup>
1205	471	XIII	400	Pseudozyma sp. JS1231 18S rRNA gene (partial), ITS1, 5.8S rRNA gene, ITS2 and 26S rRNA gene (partial), isolate 1231	80%	5,00E-134	94%	AM176740.1	<i>Pseudozyma</i>

<sup>1</sup>Based on morphological (hyphal septation and spores color, morphology, and septation, cell morphology, and division) tests.

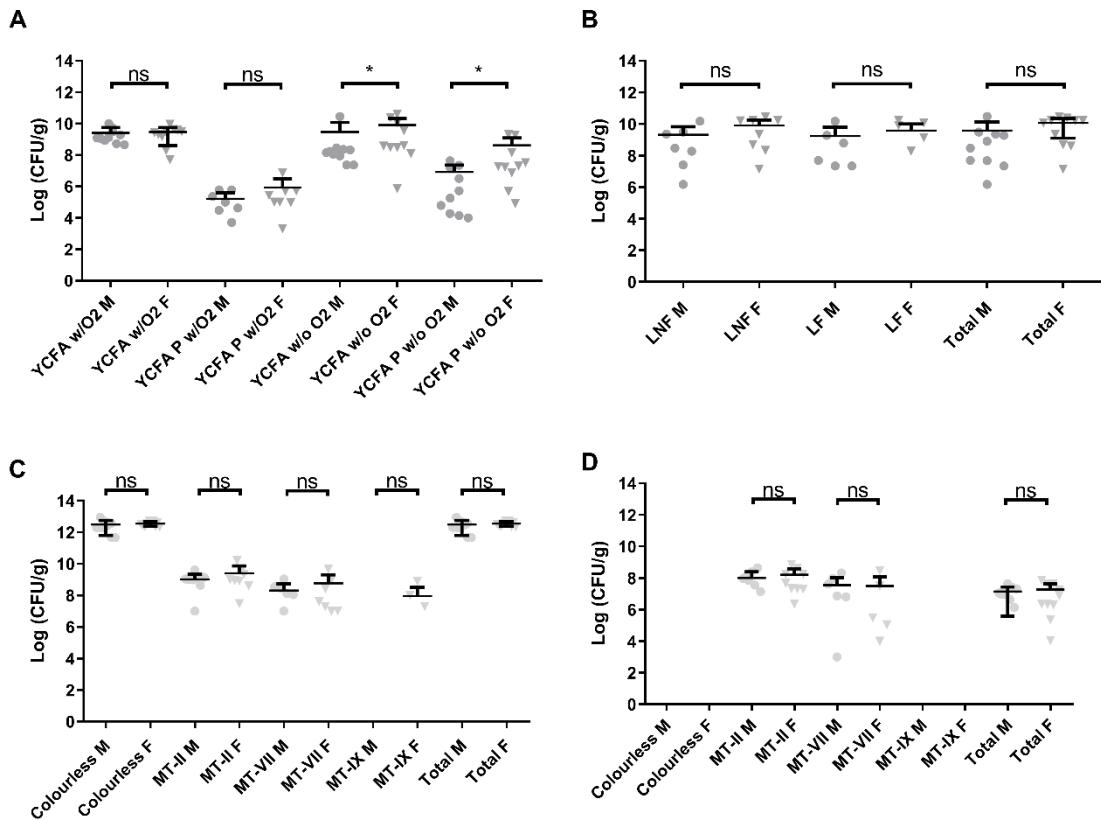

<sup>2</sup> Phylotype assignment based on information from top three best matches displaying the higher nucleotide pairwise identity, using taxonomic threshold similarity values as discussed in Material and Methods chapter.

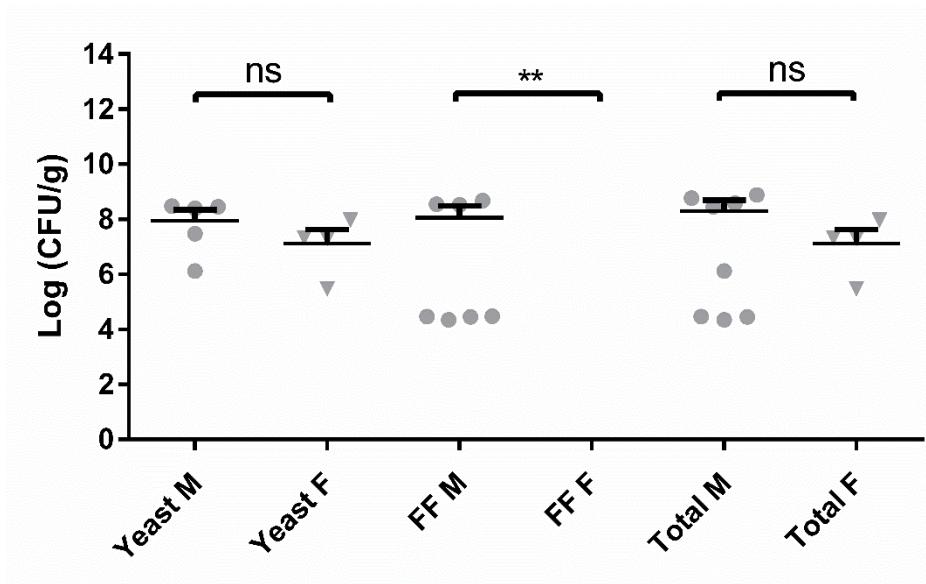

1

2 Supplementary Figure 1 – Flowchart used for differentiation of the purified bacterial isolates into different morpho-physiological types (from [25]).

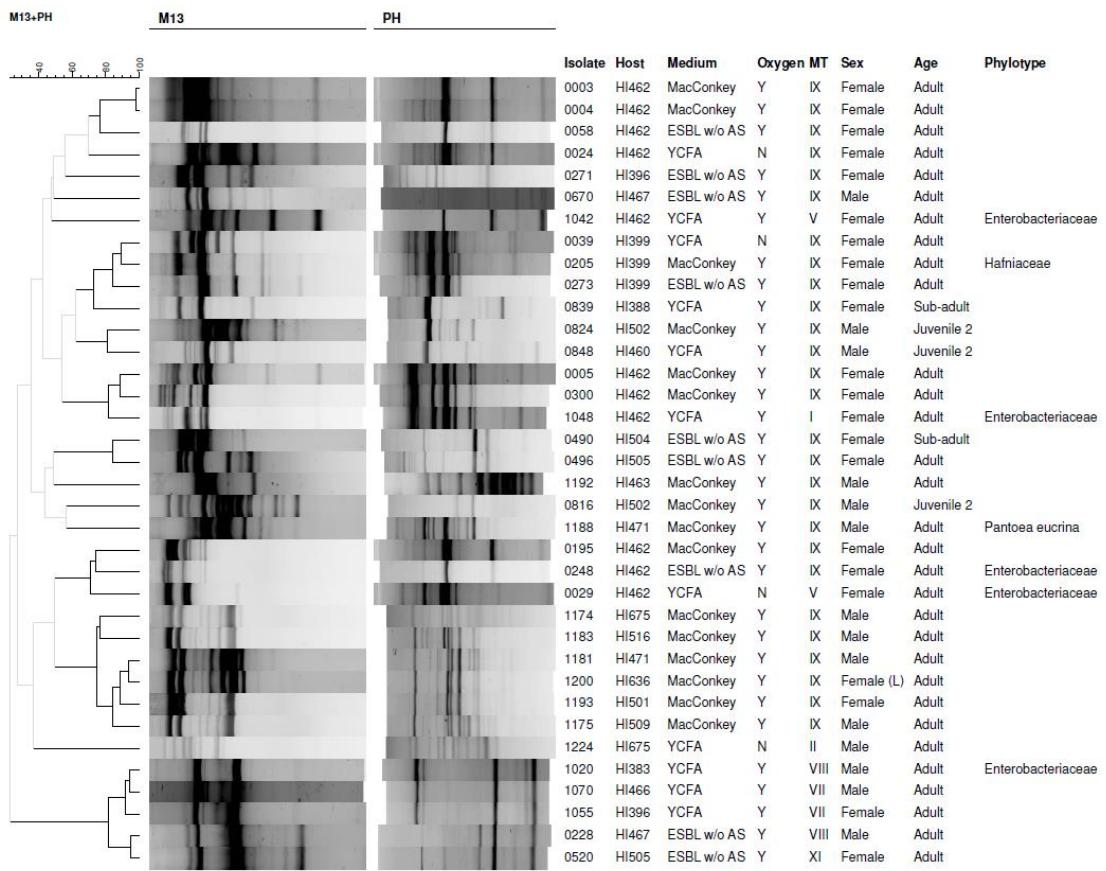

3

Supplementary Figure 2 — Microbial load (expressed as Log CFU/mL) of mongoose cultivable bacteria grown in selective and non-selective media. (A) Comparison among four different media/conditions: YCFA incubated under aerobiosis (YCFA w/O<sub>2</sub>), YCFA supplemented with sodium taurocholate and incubated under aerobiosis (YCFA P w/O<sub>2</sub>), YCFA incubated under anaerobiosis (YCFA w/o O<sub>2</sub>), and YCFA supplemented with sodium taurocholate and incubated under anaerobiosis (YCFA P w/o O<sub>2</sub>). (B) Comparison among lactose non-fermenting (LNF) bacteria and lactose-fermenting (LF) bacteria in MacConkey medium. (C/D) Comparison between Extended-spectrum beta-lactamases (ESBL) Chromogenic medium (C) without (ESBL w/o AS) and (D) with (ESBL w/ AS) ESBL antibiotic supplement with the results presented by colony color/type. Results from male (M), female (F), and in total (T) are presented. Horizontal bars represent the mean and error bars represent the standard deviation from 10 (male and female) and 20 (total) independent values. Statistical analysis was performed using a Mann-Whitney test ( $\alpha=0.05$ ). ns – non-significant ( $p\text{-value} \geq 0.05$ ); \* - significant ( $p\text{-value} < 0.05$ ).

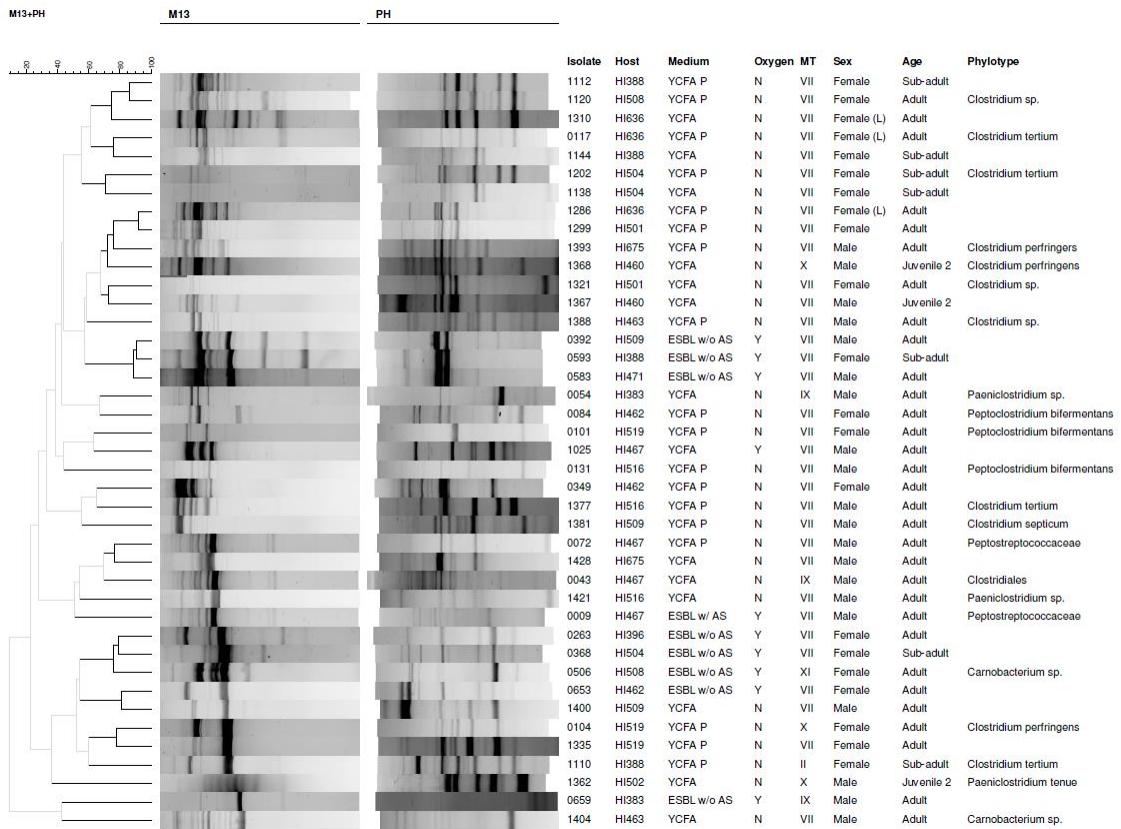

Supplementary Figure 3 – Comparison of microbial load (expressed as Log CFU/g) between male and female individuals in Potato Dextrose Agar medium with chloramphenicol (PDA w/ CHLO). Results from yeast and filamentous fungi (FF) are presented. Horizontal bars represent the mean and error bars represent the standard deviation from 10 independent values. Statistical analysis was performed using a Mann-Whitney test ( $\alpha=0.05$ ); ns – non-significant ( $p\text{-value} \geq 0.05$ ), \*\* - very significant ( $p\text{-value}=0.001$  to 0.01).

1

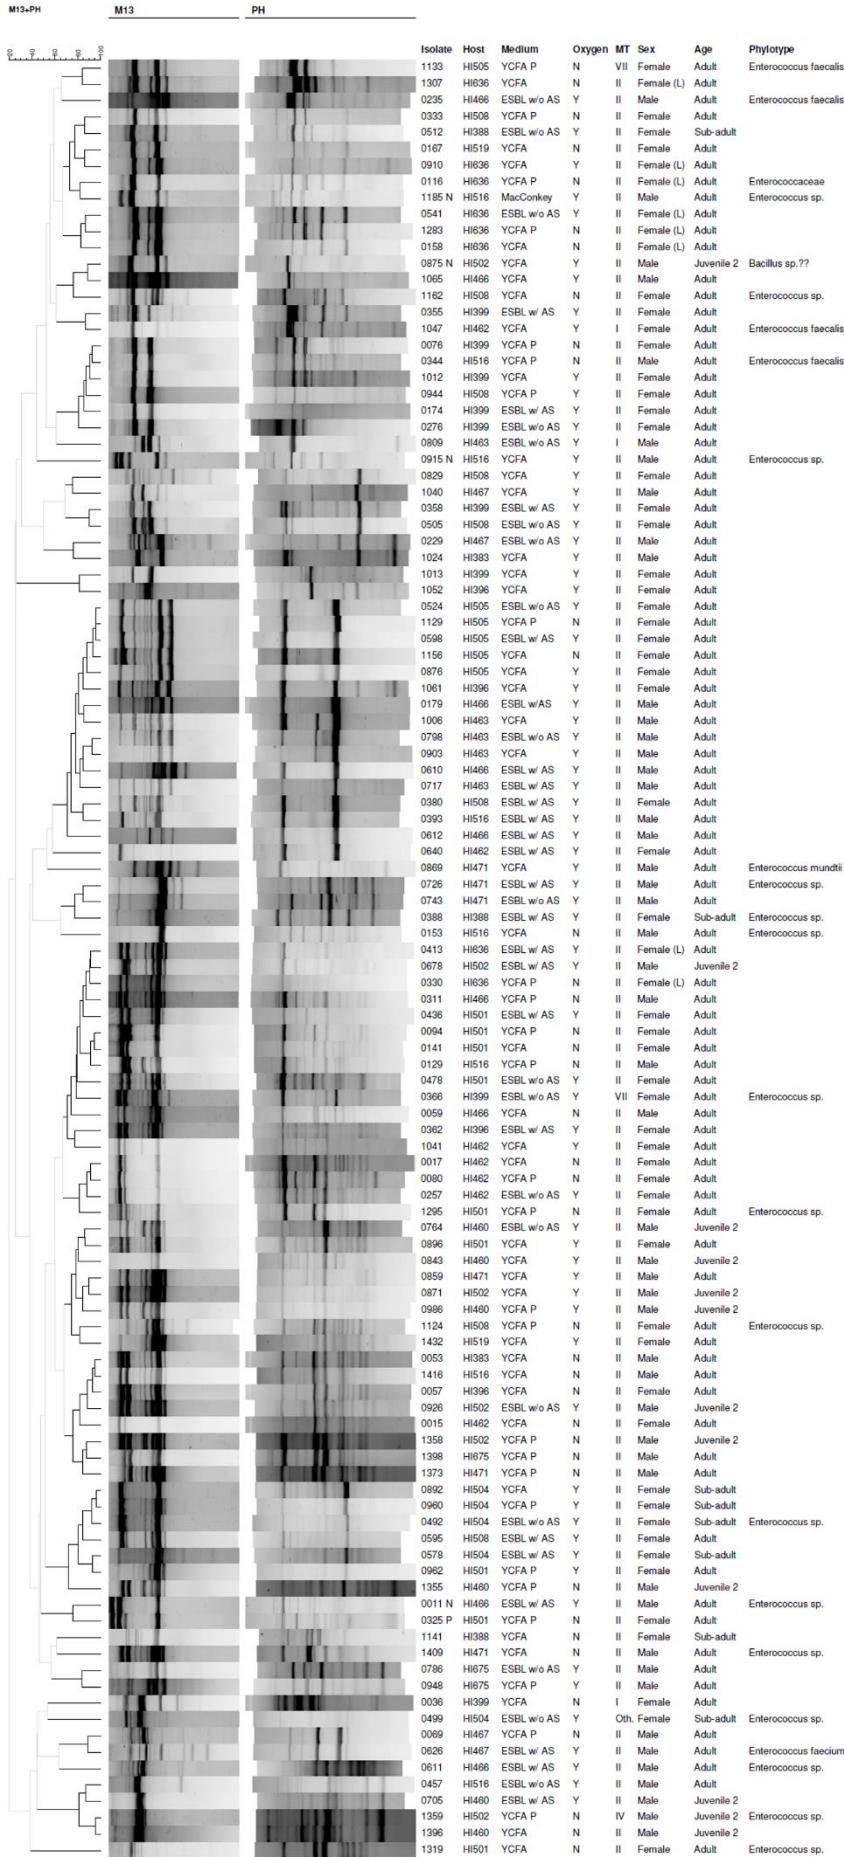

2 Supplementary Figure 4 – Bacterial isolates identification and differentiation by a hierarchical  
3 numerical analysis. The PCR fingerprints obtained for M13 and PH were integrated, similarity  
4 was calculated by Pearson correlation coefficient and clustering was performed with UPGMA.  
5 The scale corresponds to global percentage of similarity. Cut-off value for cluster formation at  
6 70% similarity. N – No; Y – Yes; (L) – Lactating.
