¹ Diploid number, ² segment, and ³ microchromosome. The data of *Myiopsitta monachus* (Psittaciformes) were not compared here because the exact fusions involving chromosomes GGA10, 11, and 12 were not identified, since a flow sorted peak including the chromosomes GGA10, 11, and 12 was used [19]. The data of *Willisornis vidua* (Passeriformes) were not compared here because the authors reported several interchromosomal rearrangements in this species, however, the exact rearrangements were not described [20].
