Supplementary information

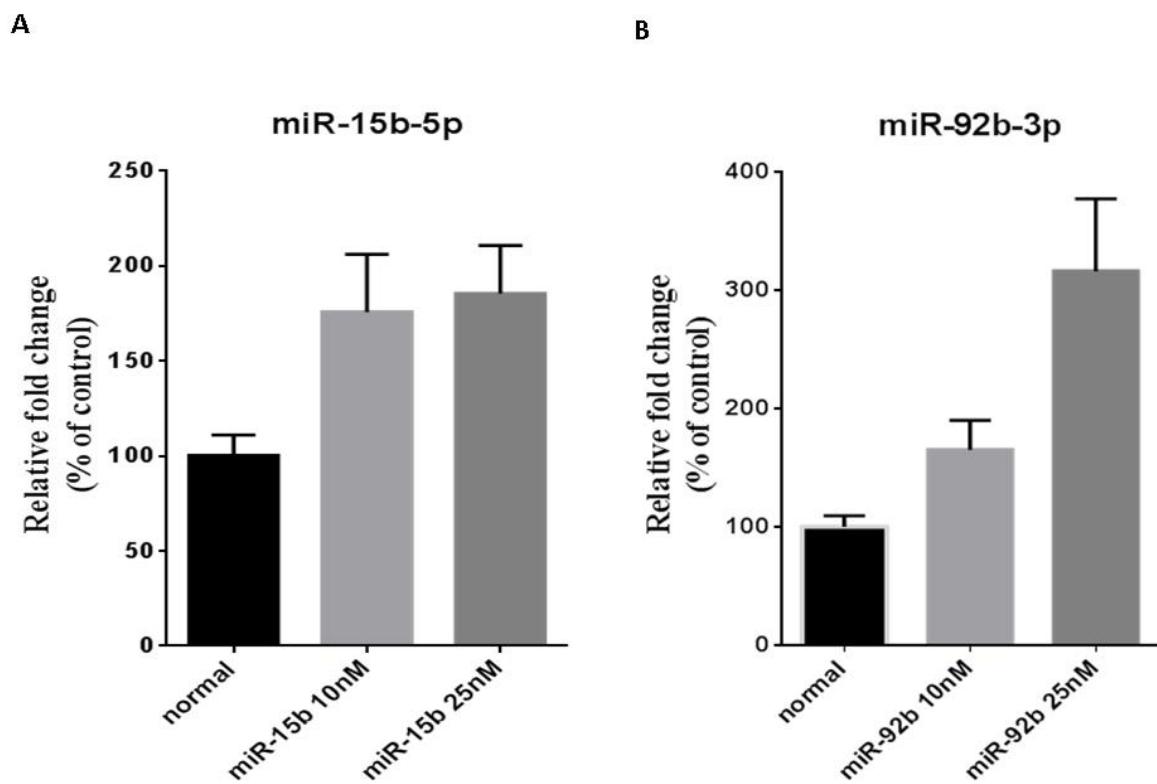

Supplementary Figure S1. The KEGG pathway of HIF-1 signaling is identified by over-representation analysis with the gene list derived from the validated target genes of the 22 OSA-related miRNAs (see Methods). The FDR-adjusted p-value of the pathways is 4.0E-4. Predicted target genes are shown in red letters and boxes with red lines.

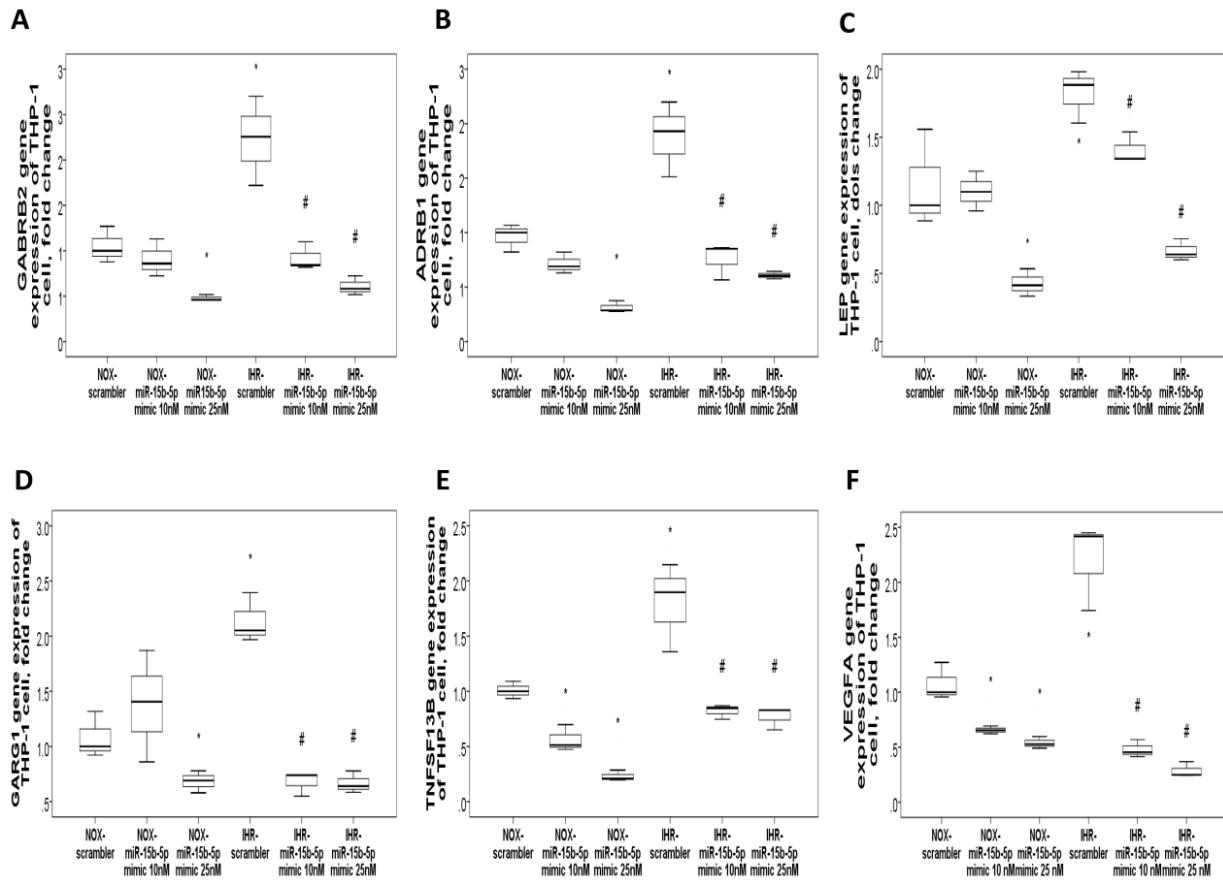

Supplementary Figure S2. Predicted direct and indirect target genes of miR-15b-5p and miR-92b-3p based on IPA and miRbase database.

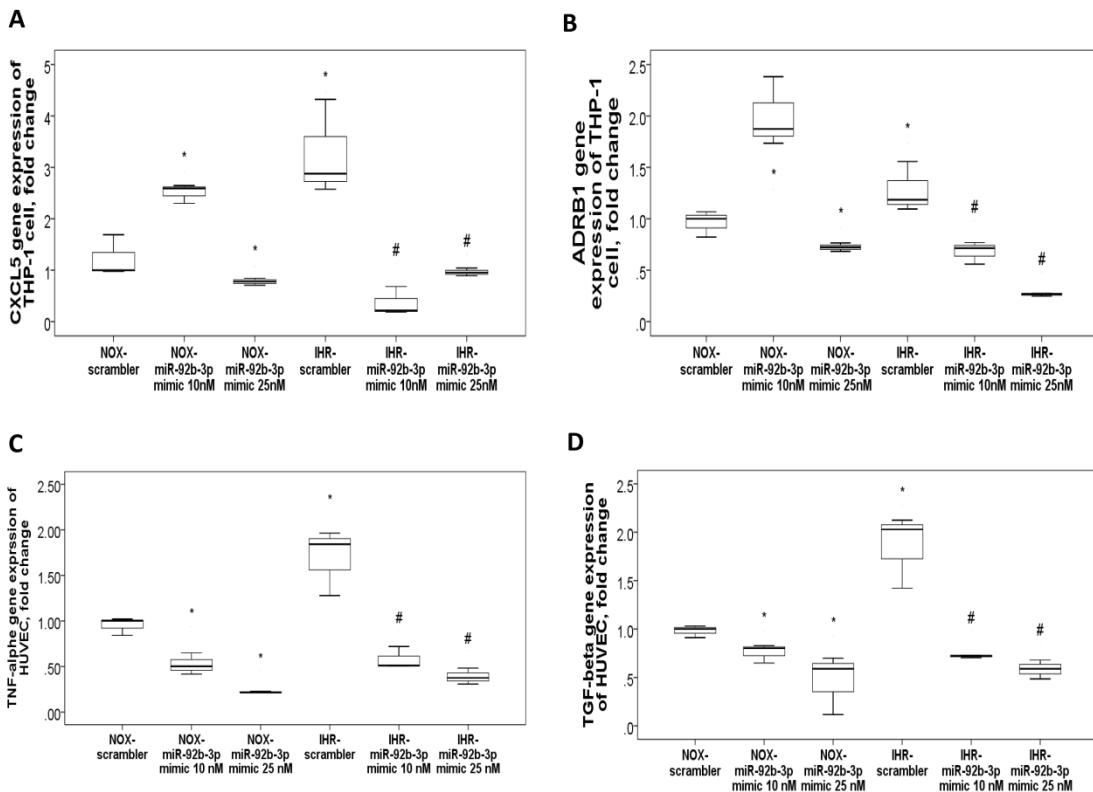

Supplementary Figure S3. Correlations of the predicted target gene expressions of miR-15b-5p/miR-92b-3p with sleep parameters and blood sugar control. Both (A) ADRB1 and (B) GABRB2 gene expressions were positively correlated with blood glycohemoglobin (HbA1C) levels. (C) TNFSF13B gene expression was positively correlated with snoring index. LEP gene expression was negatively correlated with (D) nadir SaO₂, and positively correlated with (E) percent time of SaO₂<90% and (F) HbA1c.

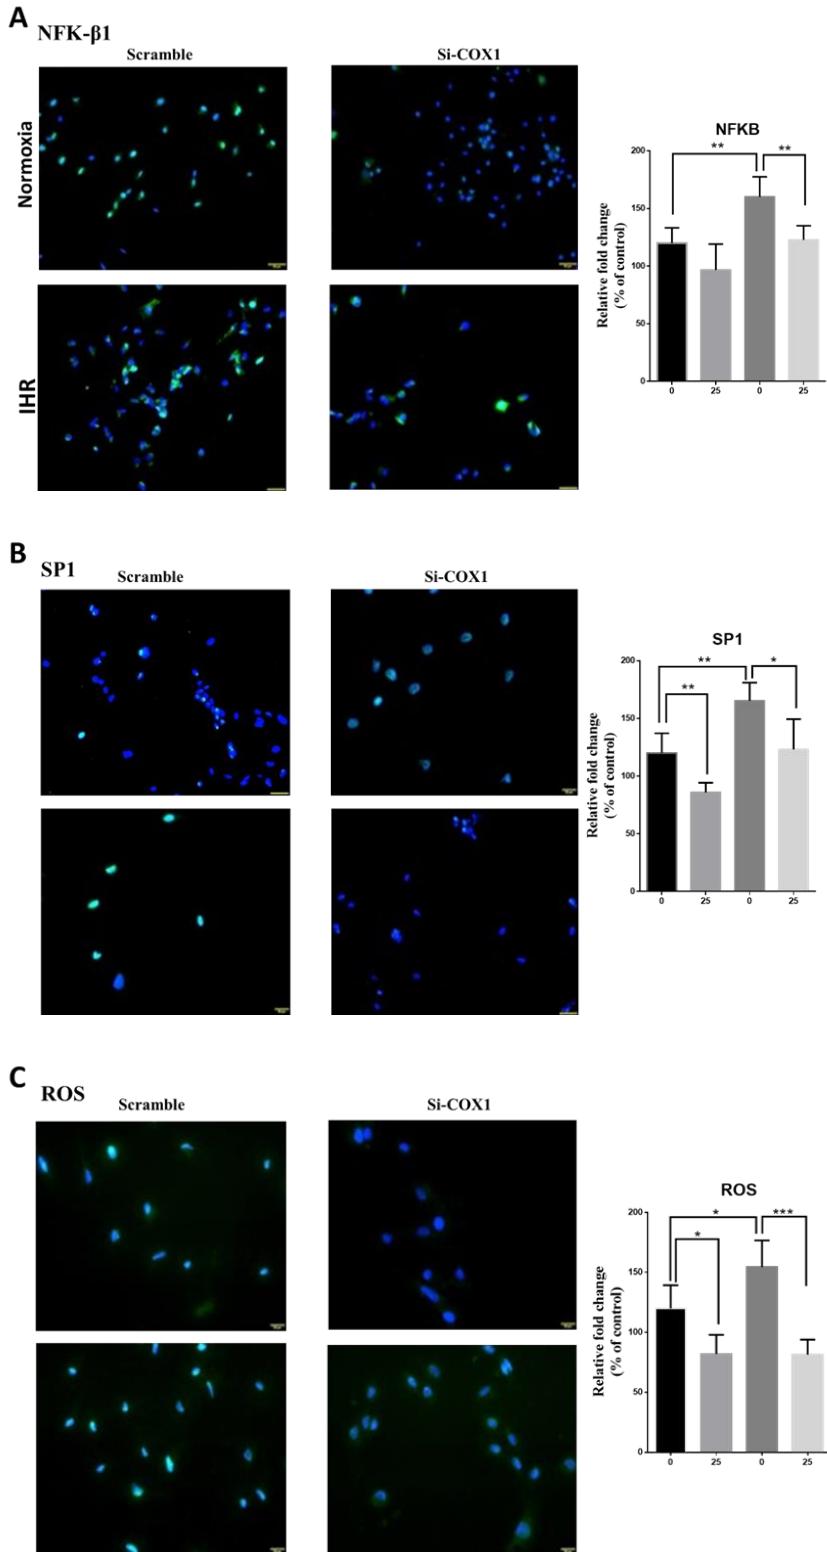

Supplementary Figure S4. Transfection efficiency of miR-15b-5p mimic and miR-92b-3p mimic in human umbilical vein endothelial cells (HUVEC). Transfection with either (A) miR-15b-5p mimic or (B) miR-92b-3p mimic in HUVEC at 10 nM or 25 nM resulted in 1.5 to 3 fold increases in their gene expression levels as compared with that of normal scrambler control.

Supplementary Figure S5. MiR-15b-5p over-expression reversed intermittent hypoxia with re-oxygenation (IHR)-induced up-regulations of its target genes. Transfection with miR-15b-5p mimic at 25 nM in THP-1 cells reversed IHR-induced up-regulations of its predicted target genes, including (A) *GABRB2*, (B) *ADRB1*, (C) *LEP*, (D) *GARG1*, (E) *TNFSF13B*, and (F) *VEGFA*.

Supplementary Figure S6. MiR-92b-3p over-expression reversed intermittent hypoxia with re-oxygenation (IHR)-induced up-regulations of its target genes. Transfection with miR-92b-3p mimic at 25 nM in THP-1 cells reversed IHR-induced up-regulations of the (A) CXCL5, (B) ADRB1, (C) TNF- α , and (D) TGF- β genes.

Supplementary Figure S7. PTGS1 (COX1) knock-down reversed intermittent hypoxia with re-oxygenation (IHR)-induced up-regulation of NF- κ B/SP1, and oxidative stress. Representative micrographs of immunofluorescence staining in SH-SY5Y neuron cells with or without the knock-down of PTGS1 under IHR versus normoxic (NOX) condition are given for (A) NF- κ B1, (B) SP1, and (C) reactive oxygen species (ROS). IHR resulted in over-expressions of NF- κ B1, and SP1, and ROS over-production, all of which were re-versed with the knock-down of COX1. DAPI (blue) is used for staining the nuclei. Localizations of the three molecules are indicated in green. All the micrographs are a merge of the two staining. Quantified values are stratified based on the response to IHR stimuli and PTGS1 SiRNA transfection. Kruskal-Wallis test with post-hoc analysis was used for comparisons between four groups. *p<0.05. **p<0.01. ***p<0.001.
