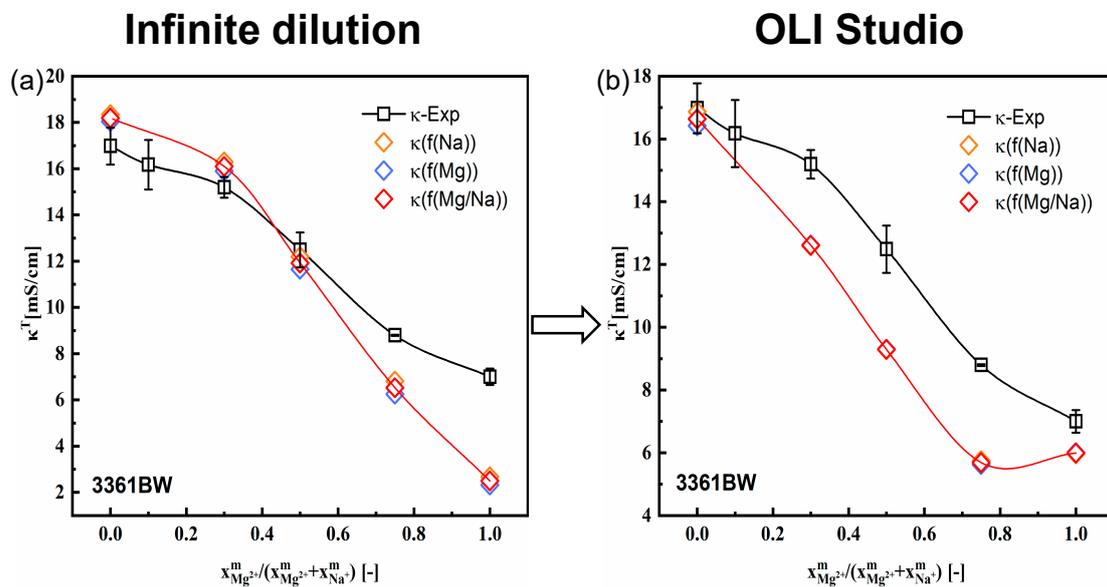

Figure S1. Comparison of the total conductivity variations for the 3361BW membrane in mixed $MgSO_4+Na_2SO_4$ electrolytes as a function of the cation composition in the external solution. The inter-gel phase conductivity (κ^{In}) is obtained via two different approaches: calculated with (a) the ionic mobilities in infinite dilution, (b) with the inter-gel phase conductivity data simulated in the OLI Studio.

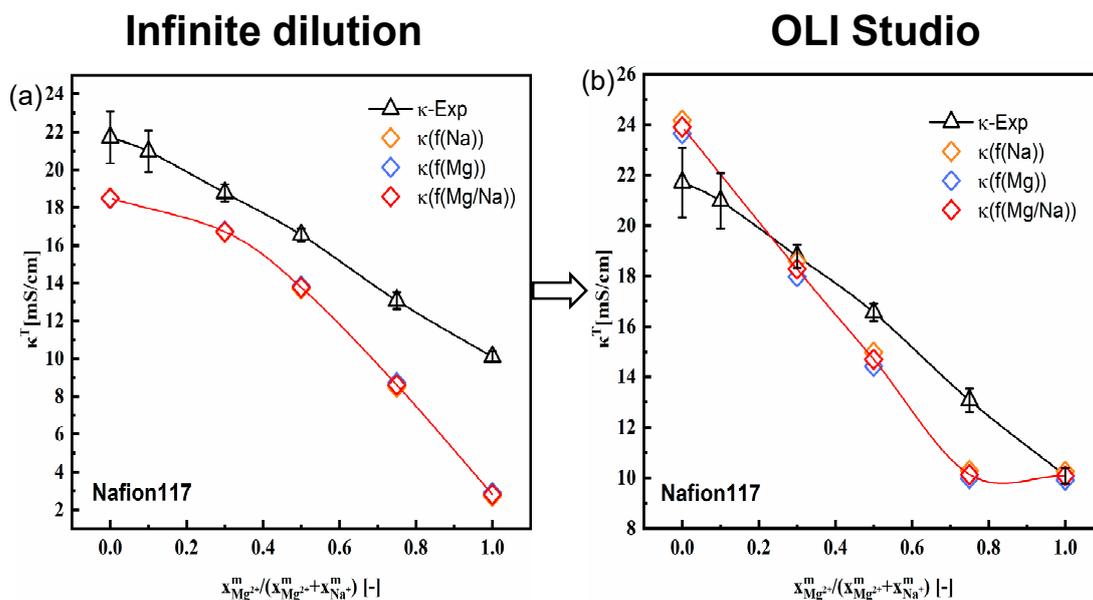

Figure S2. Comparison of the total conductivity variations for the Nafion117 membrane in mixed $MgSO_4+Na_2SO_4$ electrolytes as a function of the cation composition in the external solution. The inter-gel phase conductivity (κ^{in}) is obtained via two different approaches: calculated with (a) the ionic mobilities in infinite dilution, (b) with the inter-gel phase conductivity data simulated in the OLI Studio.

Table S1 ~ Table S8 list the numerical results of the calculated total conductivity for three CEMs in equilibrium with mixed sulfates of different total sulfate concentration (0.1, 0.5, and 1.0 M) in this work.

Table S1. The numerical results of CEMs' total conductivity under mixed $MgSO_4+Na_2SO_4$ electrolytes of different total sulfate concentration. The inter-gel phase conductivity (κ^{in}) values are obtained from the ionic mobilities in infinite dilution.

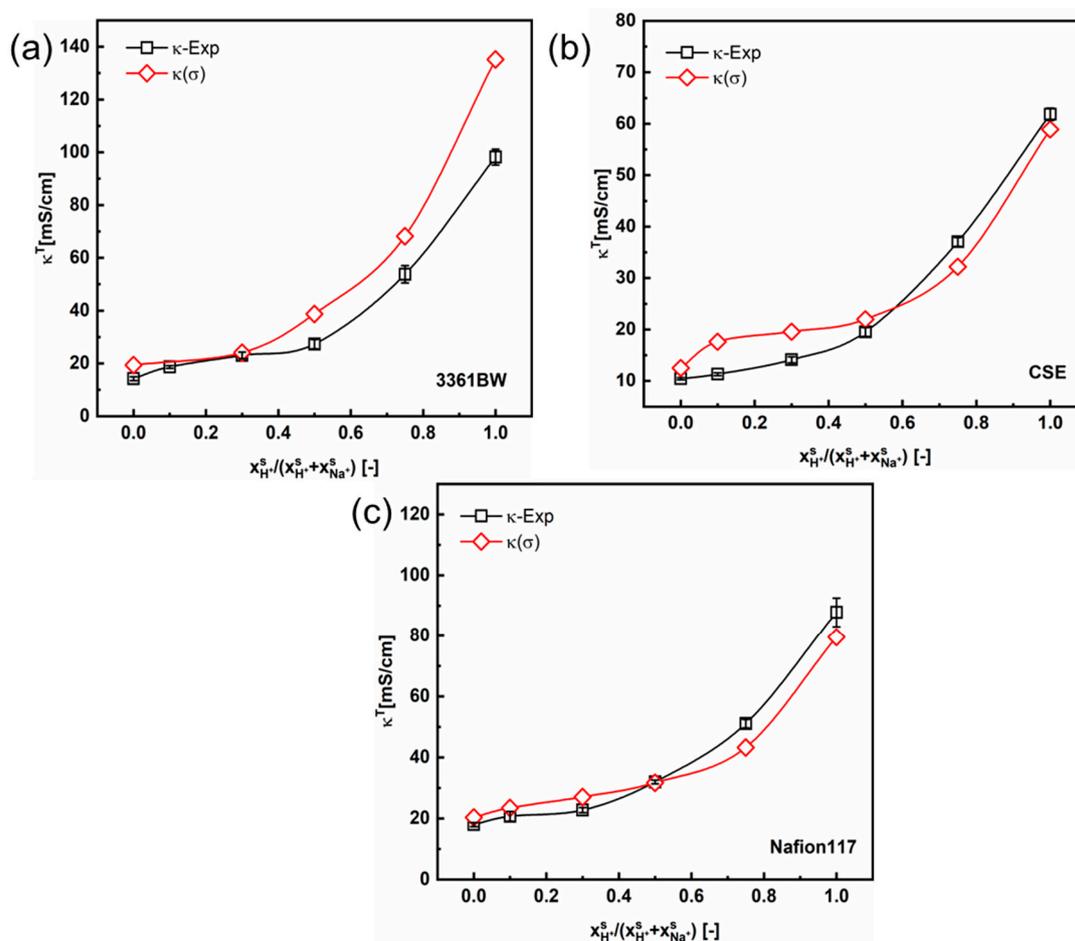

Figure S3. The variation of the experimental and the predicted total membrane conductivities with the cation composition of the mixed external $H_2SO_4 + Na_2SO_4$ electrolytes (total sulfate concentration 0.5 M). The gel phase conductivity (κ^g) of the CEMs is obtained from the nonlinear correlation method considering the interaction parameter (α).
