

Supplementary Tables

Table S1. Medications among patients with vasovagal syncope, orthostatic hypotension and negative HUT patients.

	VVS	OH	Negative HUT
Beta blockers	10.1	19.8	17.1
Loop diuretics	0.7	7.4	3.7
Hydrochlorothiazide	2.9	3.3	2.4
Spironolactone	0.7	3.3	0*
ACE	2.9*	11.7*	14.6
ARB	7.2	21.5	4.9
Alfa blockers	0	2.5	1.2
Calcium channel blockers	5.8	17.4	6.1
Antihypotensives	0.7	6.6	2.4

Values are presented as percentage values. Abbreviations: VVS=vasovagal syncope, OH=orthostatic hypotension.

ACE=angiotensin converting enzyme, ARB=angiotensin receptor blocker, HUT=head-up tilt. *n=1 missing.

Table S2A. Association between cerebral tissue oxygen saturation, systolic blood pressure and age at examination in vasovagal syncope patients.

A.	Beta	p-value
SctO2 supine	-0.019	0.317
SctO2 3 min	-0.015	0.484
SctO2 10 min	-0.015	0.502
SctO2 presyncope phase	-0.123	<0.001
SctO2 syncope	-0.034	0.200
SctO2 minimum	-0.010	0.628
Delta presyncope	0.104	<0.001
B.	Beta	p-value
SctO2 supine	-0.036	0.114
SctO2 3 min	-0.044	0.071
SctO2 10 min	-0.058	0.033
SctO2 presyncope phase	-0.096	0.001

	>60	<30	0.540
		30-60	0.980

P-values are from two way-ANOVA with Tukey's test for differences in mean SctO₂ in patients below 30 years, between 30-60 years and over 60 years of age. Delta minimum was defined as the difference in supine value and minimum value prior to reflex activation. SctO₂=cerebral tissue oxygenation.

Table S6. Cerebral tissue oxygenation according to age in negative head-up tilt tests.

	Below 30 years (n=23)	30-60 years (n=41)	Above 60 years (n=18)	p-value
SctO2 supine	72.8±4.8†	71.5±4.5	71.1±5.5	0.236
SctO2 3min	69.7±5.5	69.5±5.4	68.8±6.0	0.855
SctO2 10 min	70.0±5.2	69.9±5.0	68.6±5.5	0.619
SctO2 minimum	66.0±5.5†	66.2±4.8	64.9±5.7*	0.672
SctO2 delta minimum	6.8±3.2‡	5.3±3.6	5.5±4.3*	0.322

Continuous variables are expressed as mean ± standard deviation of the mean. P-values are from one way-ANOVA for differences in mean SctO2 in patients below 30 years, between 30-60 years and over 60 years of age. Delta minimum was defined as the difference in supine value and minimum value prior to reflex activation. *n=1, †n=2, ‡n=3 missing. SctO2=cerebral tissue oxygenation.

Table S7. Proportion of smokers according to age.

	<30 years	30-60 years	>60 years	p-value
VVS smokers (%)	6(16.7)	8(11.0)	1(3.3)	0.756
OH smokers (%)	2(15.4)	6(18.8)	10(13.2)	0.220
Negative HUT smokers (%)	9(39.1)	12(29.3)	1(5.9)	0.059*
Total smokers (%)	17(23.6)	26(17.8)	12(9.8)	0.031*

Data is defined as number of patients (percentage). P-values are from Chi-2 test. *N=1 missing. Abbreviations: VVS, vasovagal syncope. OH, orthostatic hypotension. HUT, head-up tilt test.

Table S8. Association between smoking and supine cerebral tissue oxygenation among VVS, OH and negative HUT patients.

	Smoker	Non-smoker	p-value
SctO2 supine	70.5	71.4	0.156*

Data is defined as mean supine SctO2 for VVS, OH and negative HUT patients (total=342 patients). P-values are from independent samples t-test. *N=3 missing. Abbreviations: SctO2, cerebral tissue oxygenation. VVS, vasovagal syncope. OH, orthostatic hypotension. HUT, head-up tilt test.
