

Change in the Prevalence of Chronic Kidney Disease by Different Equations for Estimated Glomerular Filtration Rates in the Korean Population Visiting Local Clinics and Hospitals

Supplementary Table S1. Equations for estimated glomerular filtration rate (eGFR)

Abbreviation	Equation	Reference
MDRD 2006	$\text{eGFR (mL/min/1.73 m}^2\text{)} = 175 \times (\text{Scr})^{-1.154} \times (\text{Age})^{-0.203} \times (0.742 \text{ if female}) \times (1.212 \text{ if African American})$	[1]
CKD-EPI 2009	$\text{eGFR (mL/min/1.73 m}^2\text{)} = 141 \times \min(\text{Scr}/k, 1)^\alpha \times \max(\text{Scr}/k, 1)^{-1.209} \times 0.993^{\text{Age}} \times (1.018 \text{ if female}) \times (1.159 \text{ if African American}),$ where k is 0.7 for females and 0.9 for males, α is -0.329 for females and -0.411 for males, min indicates the minimum of Scr/k or 1, and max indicates the maximum of Scr/k or 1.	[2]
CKD-EPI 2021	$\text{eGFR (mL/min/1.73 m}^2\text{)} = 142 \times \min(\text{Scr}/k, 1)^\alpha \times \max(\text{Scr}/k, 1)^{-1.200} \times 0.9938^{\text{Age}} \times (1.012 \text{ if female}),$ where k is 0.7 for females and 0.9 for males, α is -0.241 for females and -0.302 for males, min indicates the minimum of Scr/k or 1, and max indicates the maximum of Scr/k or 1.	[3]

Abbreviations: MDRD, Modification of Diet in Renal Disease study equation; CKD-EPI, Chronic Kidney Disease Epidemiology Collaboration study equation; Scr, serum creatinine in mg/dL that assayed using methods traceable to isotope dilution mass spectrometry assigned and certified by the National Institute of Standards and Technology reference materials.

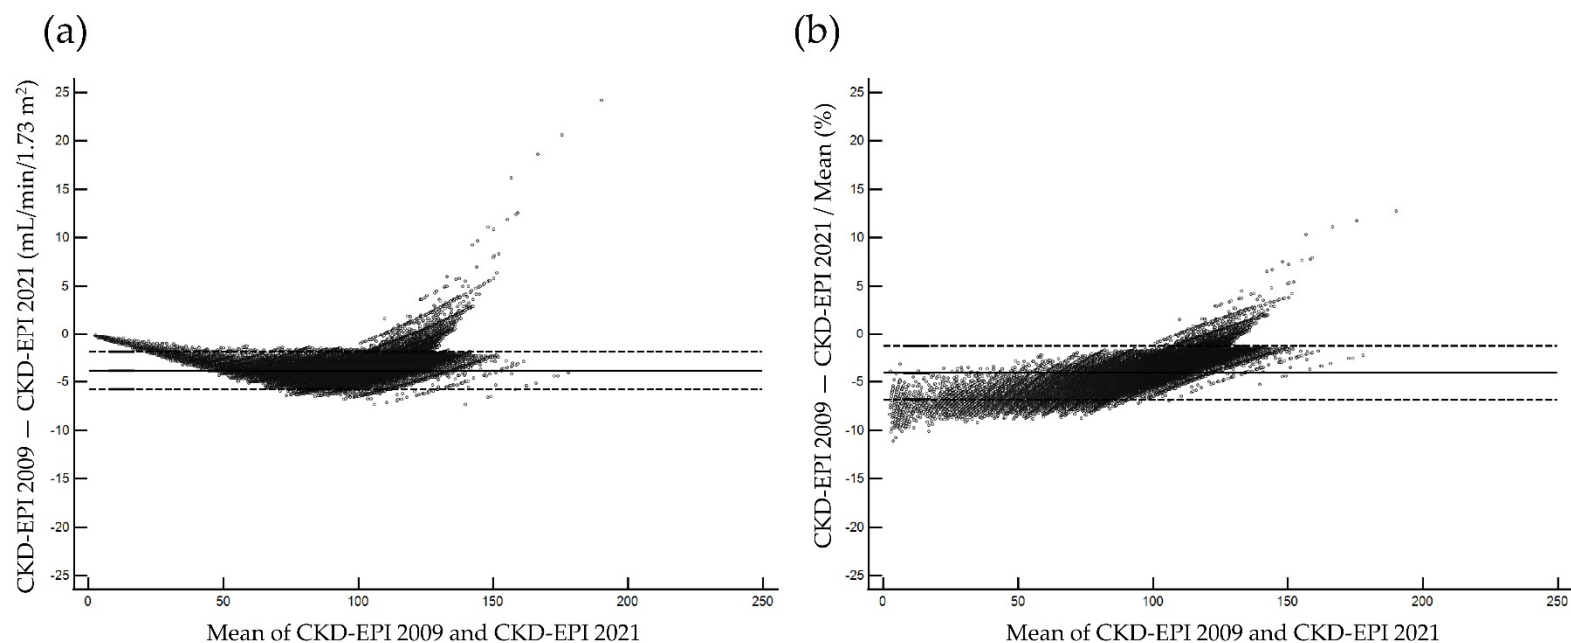

Figure S1. Comparison of eGFR values between CKD-EPI 2009 and CKD-EPI 2021 equations. (a) Difference and (b) % difference in eGFR values between CKD-EPI 2009 and CKD-EPI 2021 equations. Horizontal lines represent mean difference and mean % difference, and dashed lines represent 95% confidence interval of mean difference and mean % difference.
