2. C2HEST-OD – expansion of the C2HEST score by adding the presence of diabetes mellitus and obesity

In order to verify if including obesity and diabetes mellitus to the extended version of the C2HEST score (C2HEST-OD), we have performed the analysis presented below:

A.1 All-cause mortality (Table S2)

Table S2. All-cause mortality.

	Hazard ratio	Lower CI limit	Upper CI limit	p-value
Overall	1.2382	1.1335	1.3525	<0.0001
low vs medium	2.6670	1.3568	5.2422	0.0044
low vs high	4.2077	2.2037	8.0340	<0.0001

The change from the low to the high risk group increased the risk for death 4.21-fold vs 2.70 fold in the original version of the scale.

A.2 In-hospital mortality (Table S3)

Table S3. In-hospital mortality.

	Hazard ratio	Lower CI limit	Upper CI limit	p-value
Overall	1.2052	1.0821	1.3424	0.0007
low vs medium	1.7960	0.8411	3.8348	0.1303
low vs high	2.8402	1.3798	5.8462	0.0046

A.3. Clinical non-fatal events

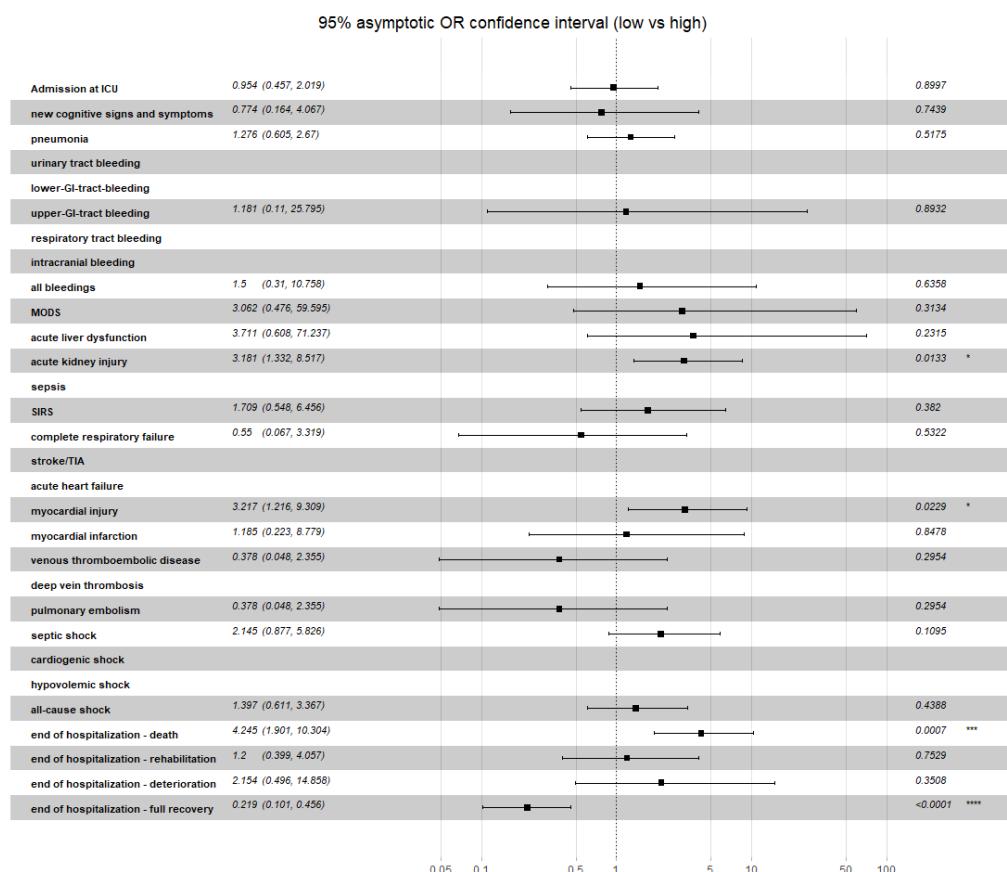

The strength of the association between CH2EST-OD score and study endpoints including non-fatal adverse events is presented in supplementary Table 4

Table S4. The strength of the association between CH2EST-score and study endpoints.

Endpoint	Type	Odds.ratio	Lower.Cl.limit	Upper.Cl.limit	p.value
end of hospitalization - full recovery	Overall	0.749	0.642	0.865	0.0001

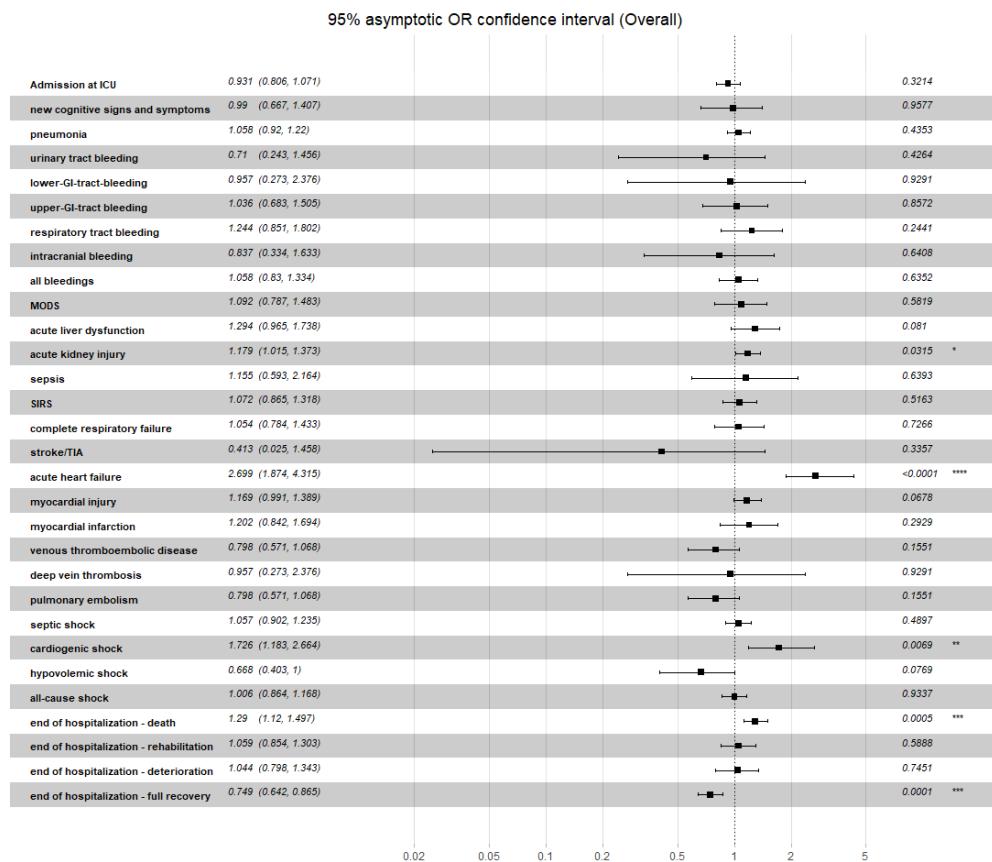

Figure S2. 95% Asymptotic OR Confidence Interval (low vs high & Overall).

3. Sub-analysis of the survival based on the ICU admission in particular C2HEST score strata

The presented below Kaplan-Meier (Figure S3) survival function presents the usefulness of the C2HEST score in predicting the mortality of elderly subjects who were admitted directly to the intensive care unit (due to COVID severity) vs. those admitted to the non-intensive ward of the medical university center due to COVID-19. The C2HEST score revealed to determine the outcome irrespectively on the initial symptom severity with the log-rank p-value of <0.0001:

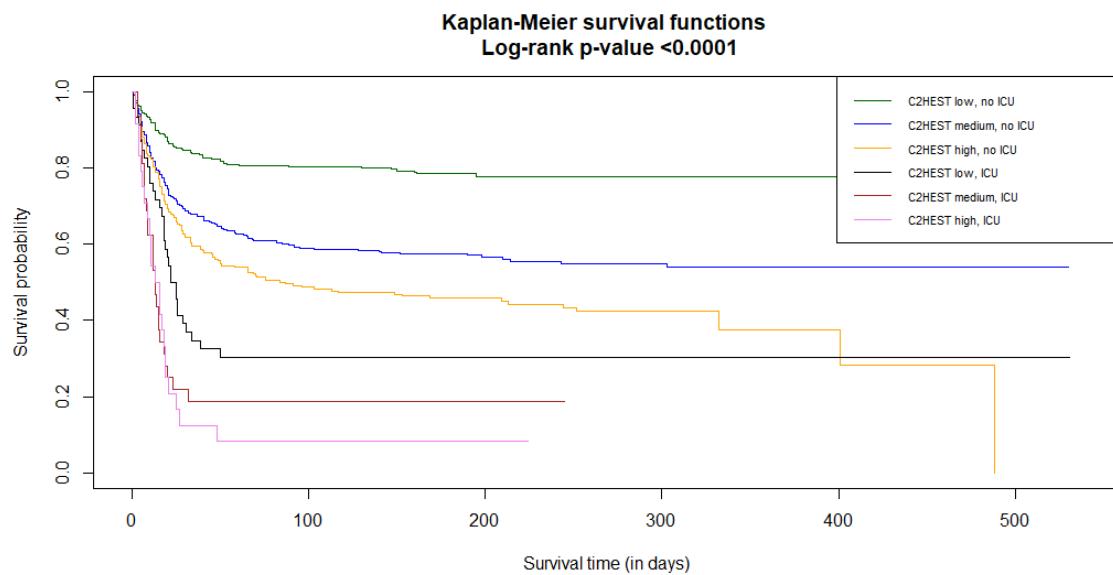

Figure S3. Kaplan-Meier survival function.

The C2HEST predictive value in transfer of COVID-19 elderly subjects to the ICU following clinical deterioration is presented in the Table S5:

Table S5. The C2HEST predictive value in transfer of COVID-19 elderly subjects to the ICU following clinical deterioration.

Endpoint	Type	Odds.ratio	Lower.Cl.limit	Upper.Cl.limit	p.value
Admission at ICU	Overall	0.950	0.841	1.068	0.3958
	low vs medium	0.593	0.366	0.950	0.031
	low vs high	0.755	0.442	1.261	0.2913

Also, the logistic regression model was developed to analyze the description of the admission at ICU by particular C2HEST components, where the strongest predictive value for ICU admission had the presence of hypertension, coronary artery disease and HFrEF (Table S6).

Table S6. The logistic regression model.

Endpoint	Component	Odds.ratio	Lower.Cl.limit	Up- per.Cl.limit	p.value
Admission at ICU	Coronary artery disease	1.443	0.831	2.446	0.1814
	COPD	0.631	0.212	1.508	0.3476
	Age	0.351	0.218	0.549	<0.0001
	Thyroid Disease	0.373	0.142	0.810	0.0239
	Hypertension	1.794	1.092	3.051	0.0251
	HFrEF	1.519	0.879	2.574	0.1261
