**Table S4:** Mean values of geometric variables of the diaphragm and thorax during early long-term follow-up at  $6 \pm 2$  months,  $12 \pm 2$  months,  $24 \pm 4$  months,  $3.5 \pm 0.5$  years and  $6 \pm 1$  year in 36 patients with left-sided congenital diaphragmatic hernia with a total thoracic area greater and smaller than the median total thoracic area ( $20,025\text{mm}^2$ ) of the control group at the age of  $10 \pm 2$  years: left diaphragmatic angle (LDA), right diaphragmatic angle (RDA), left diaphragmatic diameter (LDD), right diaphragmatic diameter (RDD), left diaphragmatic height (LDH), right diaphragmatic height (RDH), left diaphragmatic curvature index (LDCI), right diaphragmatic curvature index (RDCI), left lower lung diameter (LLLD) and right lower lung diameter (RLLD); numbers in brackets indicate the number of patients of which data was available at the respective time point during follow-up. Bold numbers indicate p values  $< 0.05$ ; n.s., not significant; °, angle in degree; mm, millimeter;  $\text{mm}^2$ , square millimeter;
