Self-rated religiosity (Ref: atheist)												
Not religious				-0.14 (0.166)					-0.16 (0.166)			
Religious					0.22 (0.191)				0.17 (0.192)			
Prayer frequency (Ref: never)												
Once a year or less often					-0.03 (0.204)					-0.02 (0.203)		
Only on service/holy days						0.12 (0.204)				0.10 (0.204)		
One or more times a week						0.03 (0.229)				0.00 (0.228)		
Several times a day						0.58+ (0.229)				0.56+ (0.228)		

						(0.301)					(0.300)
Service attendance (Ref: never)											
Once a year or less often						-0.24 (0.229)					-0.21 (0.229)
Only on holy days						-0.12 (0.224)					-0.11 (0.224)
Once a week						1.00+ (0.529)					0.94+ (0.531)
Several times a week						0.12 (0.481)					0.06 (0.476)
Observations	1,029	1,029	1,029	1,029	1,029	1,029	1,029	1,029	1,029	1,029	1,029

Note: standard errors in parentheses; \*\* p<0.01, \* p<0.05, + p<0.1; all models include an identical set of control variables, such as age, gender, marital status, educational level, employment status, and subjective income strata. The Japanese sample is composed of 555 non-affiliates (54%), 420 Buddhists (41%), 47 Others including Shintoism (5%), 4 Catholics (0.4%), and 3 Protestants (0.3%). Buddhists and Others show the same pattern as in Korea. For Protestants, one needs to consider the relatively peripheral social location of Protestantism in Japan, compared to Buddhism and Shintoism. The result shows that Protestants feel less SOC than non-affiliates and, most importantly, that this gap becomes smaller when religious action is accounted for. Therefore, the beneficial mediating effects of religious action hold true. Taken together, these results are consistent with the argument of the paper.

		(0.543)		(0.544)
Several times a week		1.29		1.28
		(0.892)		(0.892)
Observations	1,284	1,284	1,284	1,284

Note: standard errors in parentheses; \*\* p<0.01, \* p<0.05, + p<0.1; all models include an identical set of control variables, such as age, gender, marital status, educational level, employment status, and subjective income strata. The Chinese sample is composed of 1,093 non-affiliates (85%), 125 Buddhists (10%), 39 protestants (3%), 10 Catholics (1%), and 17 others (1%). Unlike the dominant pattern in Korea and Japan, Chinese religious affiliates report less SOC than non-affiliates (Model 1). This confirms my assertion that the association of categorical religiosity and SOC can vary between contexts. What is consistent is the positive mediation effect of religious action. The discount in SOC among affiliates is smaller than the otherwise big discount when I take out the mediating effects of religious action in Models 2 to 12. This implies that Chinese affiliates without much religious action feel the least SOC, while those who are active in religious action feel relatively greater SOC.

Observations	57,822	57,822	57,822	57,822	57,822	57,822	57,822	57,822	57,822	57,822	57,822
Number of groups	49	49	49	49	49	49	49	49	49	49	49

Note: standard errors in parentheses; \*\* p<0.01, \* p<0.05, + p<0.1; all models include an identical set of control variables, such as age, gender, marital status, educational level, employment status, and subjective income strata. The 49 countries are as follows: Algeria, Armenia, Australia, Azerbaijan, Belarus, Brazil, Chile, China, Colombia, Cyprus, Ecuador, Estonia, Georgia, Ghana, Hong Kong, India, Iraq, Japan, Jordan, Kazakhstan, Kyrgyzstan, Lebanon, Libya, Malaysia, Mexico, Netherlands, New Zealand, Nigeria, Pakistan, Peru, Philippines, Poland, Romania, Russia, Rwanda, Singapore, Slovenia, South Africa, South Korea, Spain, Sweden, Thailand, Trinidad and Tobago, Turkey, Ukraine, United States, Uruguay, Uzbekistan, and Zimbabwe. The world sample of 49 countries is composed of 11,392 Catholics (19%), 11,318 Muslims (19%), 10,127 non-affiliates (17%), 9,788 Others (17%), 7,088 Orthodox Christians (12%), 4,967 Protestants (8%), 2,564 Hindus (4%), 1,958 Buddhists (3%), and 135 Jews (0.2%). Others, Protestants, and Catholics show greater levels of SOC than non-affiliates (Model 1). These advantages become smaller when religious action is accounted for (Models 2 to 12). Among Muslims, Orthodox Christians, and Buddhists, affiliational status has little or negative effects on SOC when religious action is not yet considered (Model 1). When the effects of religious action are taken out, the negative associations become bigger (Models 2 to 12), confirming that religious action has positive effects.
