

Full version of the tables

Tables in this article have been decreased in complexity. Complete versions of these tables can be found here:

Table 4-S. Shortlist of the 10 most abundant proteins eluted from the implant surfaces after different incubation times. These proteins were selected among top 200 proteins identified with the highest number of peptides (based on all datasets). For each localization (intracellular/membrane, secreted to blood, ECM), proteins were ranked based on the average abundance in the respective group. The rank of proteins belonging to the top 10 with the highest abundance is in bold. Proteins are sorted based on the abundance rank in the compiled dataset. Abbreviations: Avg. Abund. – ppm normalised protein abundance, ECM – extracellular matrix.

Name	# peptides	Compiled dataset (n=26)		Rough surface, 2min (n=7)		Rough surface, 5min (n=6)		Smooth surface, 2min (n=7)		Smooth surface, 5min (n=6)

Table 6-S. Selected proteins with significantly different abundance between 2 and 5 min exposure *in situ*. Differentially abundant proteins among top 200 proteins identified with the highest number of peptides (based on all datasets) are presented. For these proteins, respective results are also provided for the comparison between the different implant surfaces. Significant changes ($p<0.05$) in the respective comparisons are highlighted in bold. Fold change was calculated by dividing the average abundance of the respective proteins from the case versus the control group.
