Supplementary Material

Teeth of both species were placed in a mould, covered in Spurrs resin and put in an oven at 60 °C for 12 hours to allow the resin to set. The teeth were then ground in the longitudinal and transverse sections and the exposed areas were polished with $0.2 \,\mu\text{m}$ aluminium powder. The samples were sonicated in distilled water for 2 minutes and then etched with $10 \,\%$ hydrochloric acid for 2 minutes and rinsed in distilled water for 5 minutes. They were carbon coated in an evaporation coater and viewed with a Tescan MIRA SEM at $5 \,\text{kV}$.

Samples of *I. oxyrinchus* teeth were acquired from Hout Bay, South Africa. The *C. taurus* teeth samples had been shed naturally teeth and were kindly provided by Two Oceans Aquarium, Cape Town, South Africa. The teeth originate from one or more of the 5 adult females living in captivity (but born free) at the aquarium, weighing 80 kg to 170 kg. Teeth samples were stored at ambient conditions before specimen preparation and imaging.

This supplementary material contains further SEM figures taken during the study.

(a) overview

(d) inner enameloid close to dentine **Figure S1:** Enameloid of *I. oxyrinchus* in transverse section.

(b) enameloid and dentine

(e) zoom into inner enameloid

(c) inner enameloid close to dentine
