Materials and Methods

Instrumental characterization of samples

The FTIR spectra were collected by Nicolet iS10 spectrometer in the ATR-FTIR mode. This spectrometer was equipped with ATR assembly of model Golden Gate (part number GS10500 from Specac, Fort Washington, PA, USA) with a diamond ATR crystal. The software for data acquisition was OMNIC, where spectral resolution was 4 cm^{-1} and optical aperture at “Open”.

To avoid effects of water vapor in ambient air on spectra, the interior of the FTIR spectrometer has been purged with the IR purge gas (dried air of very low humidity) at flow rate 30 scfh (standard cubic feet per hour) as measured by flowmeter (model RMA-7 from Dwyer Instruments, Michigan City, IN, USA). Dried air was generated by FT-IR Purge Gas Generator (model 74-5041 Parker Balston, from Parker Hannifin Corporation, Haverhill, MA, USA) which contains a built-in air compressor. This unit creates dried air of the spectroscopic quality; the remaining water vapor content (per specifications) is equivalent to a dewpoint of $-100\text{ }^{\circ}\text{F}$ ($-73\text{ }^{\circ}\text{C}$) which corresponds to relative humidity $\text{RH} < 1\%$. Additionally, this purge gas generator removes CO_2 from the air to less than 1 ppm. To monitor the quality of FTIR spectra continuously and remove any remaining artifacts due to trace water vapor, in the OMNIC program the “Atmospheric Correction” parameter was enabled, and “Spectral Quality Results” parameter set at “ H_2O level” $\geq 95\%$. The obtained ATR-FTIR spectra have been plotted in the absorbance mode. Numeric peak fitting of the ATR-FTIR spectra was conducted by OriginPro 2016 program from OriginLab, Northampton, MA, USA.

The Raman spectra were collected using confocal Raman microscope model XploRA Plus from Horiba Scientific, Piscataway, NJ, USA. The magnification of objective was x50 and the 405 nm laser was used at 1 % of maximum power. A small amount of compound 2 was placed on the microscope glass slide, covered with thin microscope glass cover slide, and Raman spectra of specimen were collected; in work with compound 2 and DES, additionally few drops of DES were added. The Raman spectra were collected in the range $70\text{--}2000\text{ cm}^{-1}$.

Powder X-Ray diffraction (XRD) traces were collected by the diffractometer model MiniFlex from Rigaku, Auburn Hills, MI, USA. It uses X-rays at the Cu K-alpha line of 0.15418 nm and increments of the 2θ angle were at 0.02 degrees.

Fabrication of hemi-spherical gas flow spectroscopic mini-chamber

The hemispherical body of the described spectroscopic mini-chamber was fabricated from a template: transparent acrylic dome (hemisphere) of 1" diameter (from SupremeTech), shown in Figure S1. First, the through hole was drilled at the center of the top of the template, to accommodate the screw of the ATR assembly. Then, the hemisphere template was inverted, its internal volume filled with colorless transparent epoxy mixed with hardener (Doctor Resin & Chemicals, Sarzana (SP), Italy), then stainless steel sapphire anvil (product 10531 from Specac) with its tip up was placed inside the mixture. The mixture was leveled to the edges of the inverted hemisphere, to create the empty internal volume of this spectroscopic mini-chamber at only a few cubic millimeters. The mixture inside the template was allowed to solidify for 24 hours. Then, two holes were drilled through the front and rear sides of spectroscopic mini-chamber and two pieces of soft silicone tubing (of 1/16" ID x 1/8" OD) were inserted to the holes, to create gas inlet port (see 4 in Figure 3) and gas outlet port (see 5 in Figure 3). In this design, gas inlet port and gas outlet port can be interchangeably used. Finally, to ensure gas tightness, a flat adhesive mini O-ring was cut from soft silicone adhesive sheet (hardness 50 Durometer) of 1 mm thick, placed between the mini-chamber and the ATR baseplate, and the ATR bridge assembly was locked.

Results and Discussion

Figure S1. The starting template for making spectroscopic mini-chamber.

Model#2 distal pyrrole rings fixed at 6.0 Å separation

4. Al-TCPPh₂ C_s symmetry "Al-TCPPh₂ sandwich-fix" aka al-linker5aa-fix

Standard orientation:
