The EMI shielding performance was measured by using a vector network analyzer (E5063A ENA, Keysight Technologies, USA) with an airline kit (85051BR03) in the frequency range of 2–18 GHz based on the coaxial method. The samples were cut into a rectangular shape (with inner and outer diameters of 2 and 3 mm, respectively). The samples were sandwiched between two rectangular sample flanges. The scattering parameters ( $S_{11}$  and  $S_{21}$ ) were collected to calculate the coefficients of reflection ( $R$ ) and absorption ( $A$ ). Finally, the shielding effectiveness of reflection ( $SE_R$ ), absorption ( $SE_A$ ) and total shielding effectiveness ( $SE_T$ ) were determined using the following equations:

$$R = |S_{11}|^2 \quad (1)$$

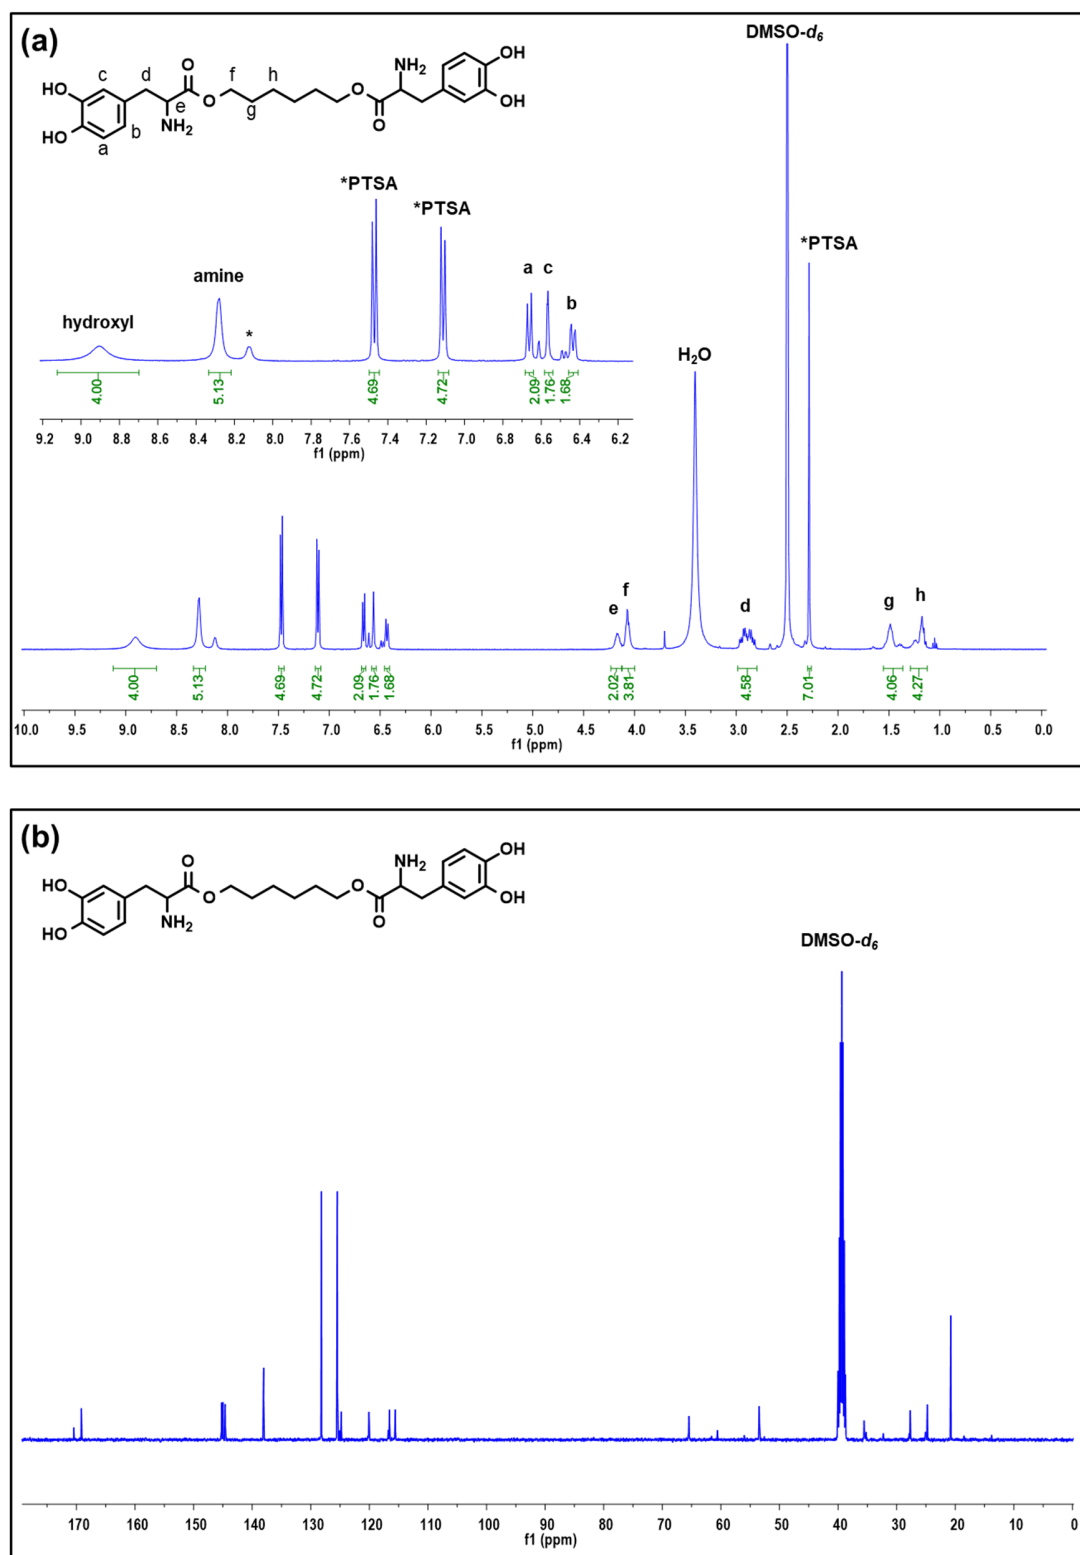

$$T = |S_{21}|^2 \quad (2)$$

$$A = 1 - R - T \quad (3)$$

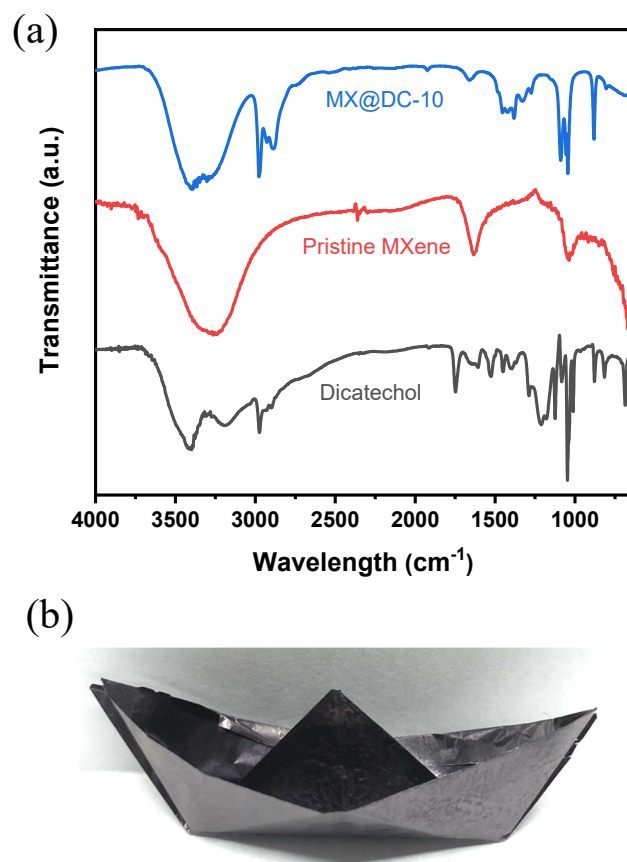

$$SE_R = -10 \log_{10}(1 - R) \quad (4)$$

$$SE_A = -10 \log_{10}[T/(1 - R)] \quad (5)$$

$$SE_T = -10 \log_{10}(T) \quad (6)$$
