

## Intraocular pressure changes during hemodiafiltration with two different concentrations of sodium in the dialysate

Based on the difference in IOP within the first hour, mean IOP in the fixed sodium profile group was  $19.6 \pm 5.6$  mmHg and individualized profile  $17.8 \pm 3$  mmHg, we used G\*power software v. 3.1.9.7 to calculate the achieved statistical power of a t test with matched pairs. We computed an effect size of 0.56, considering an  $\alpha$  error probability of 0.05. With this pilot study, we estimate that the required sample size to achieve a statistical power of 0.85, given this effect size, is 31 subjects (Figure S1).

**Figure S1.** Achieved statistical power calculation.
