Supplementary material

S1. Interspecies multiple sequence alignment of the target epitope of antibodies used

S1.1 *Bruchpilot* (Gene ID: 35977)

S1.2 *Elav* (Gene ID: 31000)

S1.3 *Futsch* (Gene ID: 6724864)

S1.4 *Gephyrin* (Gene ID: 10243)

S1.5 *Phosphosynapsin* (Gene ID: 6853)

S1.6 *Choline acetyltransferase* (Gene ID: 42249)

S1.7 *Glutamine synthetase* (Gene ID: 2752)

S1.8 *Tyrosine-hydroxylase* (Gene ID: 25085)

The *in silico* assay for protein homologs identified respective protein sequences for *Drosophila melanogaster* and mosquito species such as *Culex quinquefasciatus*, showing homology between 39 to 65 % and 40 to 70 %, respectively. The homology to *Culex pipiens* biotype *molestus* could not be assessed due to lack of available sequences for comparison. The protein sequence alignments for each protein are shown below and further comprise percentage identity matrices for the respective protein. The epitope of interest is highlighted in yellow if provided by the manufacturer.

Sequence identities were marked underneath the protein alignment as follows:

* (asterisk): indicates single fully conserved amino acid,

. (period): indicates strongly similar amino acids between groups,

: (colon): indicates weakly similar amino acids between groups.
