

Supplementary Material

Table S1: Stable isotopic signature of *D. magna* of the different dietary treatments at the last sampling time [h]. Shown are the stable isotopes values, the trophic discrimination factors (Δ_{T4}) at the end of the experiment (96 h) as well as the difference between the end and the initial values (δ_{T4-T0}). For *M. aeruginosa* we used the end values at 72 h (after diet switch) due to high mortality rate of *D. magna* fed on the algae.
