

Supplementary Figures

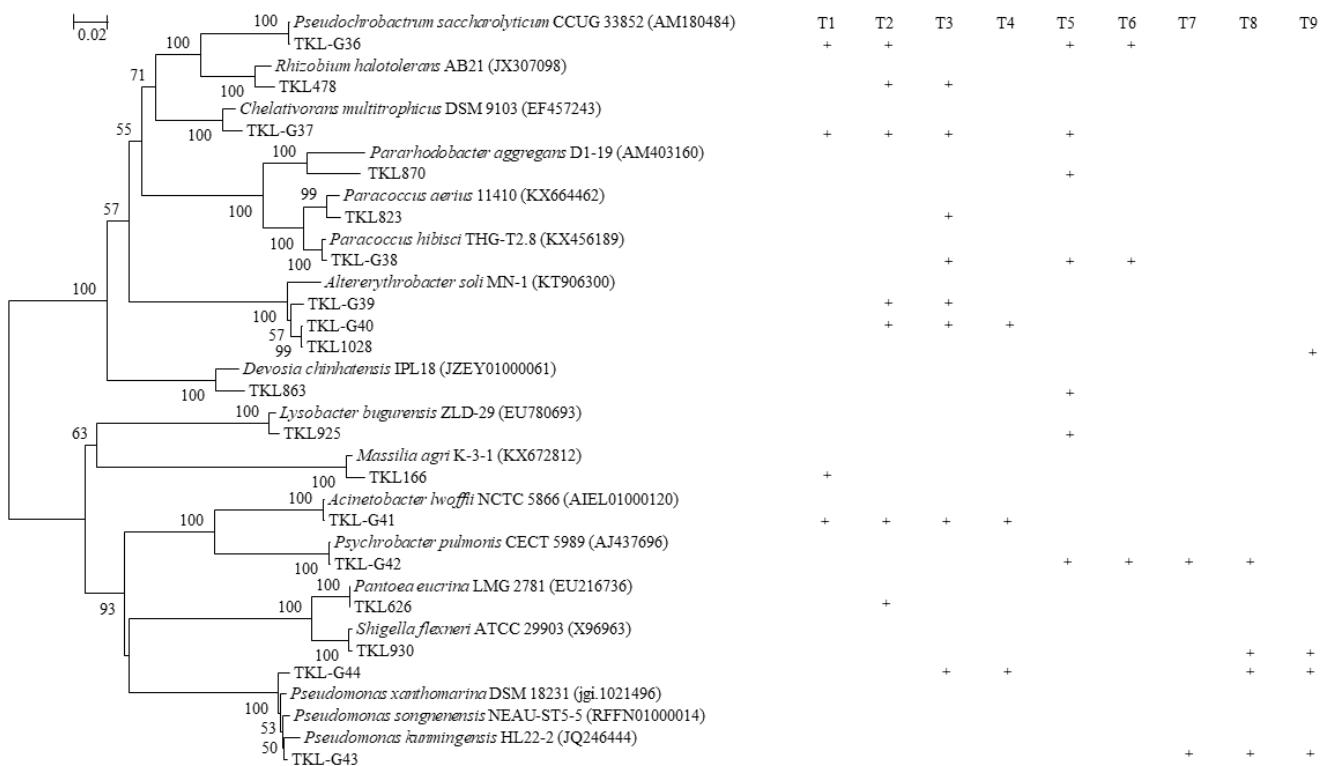

(A)

(B)

(C)

(D)

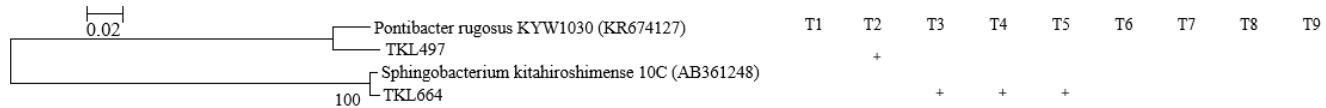

Figure S1. Neighbour-joining phylogenetic trees of the phyla of Actinobacteria (A), Firmicutes (B), Proteobacteria (C), and Bacteroidetes (D) based on the 16S rRNA gene sequences and the distribution of the phylotypes. The symbol + refers that the stain was cultured in the sites (T1~T9). The TKL-GN (N = 1~44) represent strain of the group 1 - 44, in which the strains from the same group have the higher similarity than 99% of the 16S rRNA gene sequences (Details in Table S1). The numbers at the nodes indicate the level of bootstrap support based on neighbor-joining tree reconstruction with 1000 resampling; bootstrap values higher than 50% are showed.

Supplementary Table

Table S1. Phylogenetic similarity and color of culturable bacteria in the Taklimakan Desert

Strain No.	Similarity Strain	Accession No.	Similarity/ %	Group	Color
