Supplementary Figure S1. Imaging MS and annotated molecules by METASPACE using NPA. All annotations filtered by organism type, genus, and then hand selected for reasonable ion distribution, resulting in the 13th to 53rd highest ranked annotations. Optical image of *Streptomyces griseus* subsp *griseus* 40236, *Bacillus subtilis* BGA 618, *Pseudomonas savastanoi* 722, *Streptomyces coelicolor* A2(3) / M145, *Streptomyces lividans* PM66, *Rhodococcus erythropolis* 43066, *Rhodococcus opacus* 43205, *Streptomyces roseolilacinus* 40173, *Streptomyces mobaraensis*, *Pseudomonas putida* RW10S2, from left to right, top to bottom. Ion images are arranged from increasing to decreasing MSM score from left to right, top to bottom, while m/z 228 was selected as a background ion image to show the locations of all the bacteria. Each ion image is denoted by the adduct detected, molecule name, the monoisotopic m/z value, MSM score, and FDR percentage. Molecule names with an * represent annotations with potential analogs.

Supplementary Figure S2. Average mass spectrum of the entire imaging area (outlined in pink) including all 10 microbes. The imzML file was loaded into MSIReader (v1.01) and the polygon tool was used to select the region of interest, followed by exporting and viewing the average mass spectrum from the selected pixels.
