Table S4: Models testing the responses of life-history and physiological traits to $p\text{CO}_2$ and stage (+ covariate when needed). AIC, R^2 and adjusted R^2 are given for each equation. Bold R^2 shows the best fitted model based on AIC selection for each trait, following the rule of parsimony when AIC differ for less than a value of 2: i.e. when AIC are comparable the simpler model was consider as the best-fit model.

	Linear lm(days~covariate + $p\text{CO}_2^*\text{stage}$)		Logarithmic lm(days~ covariate + $\log(p\text{CO}_2)^*\text{stage}$)		Polynomial (2 nd degree) lm(days~ covariate + $\text{poly}(p\text{CO}_2,2)^*\text{stage}$)		Polynomial (3 rd degree) lm(days~ covariate + $\text{poly}(p\text{CO}_2,3)^*\text{stage}$)

Table S7: Physico-chemical parameters (mean \pm SE) of the different $p\text{CO}_2$ treatments for larval setup ($n_{\text{kreisels}} = 4$ per $p\text{CO}_2$ condition) and juvenile setup ($n_{\text{tanks}} = 3$ per $p\text{CO}_2$ condition). Seawater temperature, salinity, oxygen content, pH_T (pH on the total scale) and total alkalinity (A_T) were measured whereas the other parameters of the carbonate system were calculated with CO2sys software (Lewis & Wallace, 1998). $p\text{CO}_2$: CO_2 partial pressure; DIC: dissolved inorganic carbon; HCO_3^- : bicarbonates concentration; CO_3^{2-} : carbonates concentration; Ω_{Ca} : saturation state of seawater with respect to calcite and Ω_{Ar} : saturation state of seawater with respect to aragonite.

Figure S1. Metabolomic fingerprinting stages III to IV. Metabolome differences between $p\text{CO}_2$ groups in lobster larval stages III, IV and V **(a)** PCA 2D score plot with 95% confidence intervals for stage III, **(b)** PCA 2D score plot with 95% confidence intervals for stage IV, **(c)** **(c)** PCA 2D score plot with 95 % confidence intervals for stage V, **(d)** PLS-DA scores plot with 95% confidence intervals for stage V. Model validation was calculated by the prediction accuracy during training test statistic with 1000 permutations, $p = 0.016$, **(e)** PLS-DA Variable Importance in Projection scores (VIP > 1 for significance). None of the metabolites were significant in the univariate ANOVA (FDR 0.05). $p\text{CO}_2$ groups: 1 – 400 μatm , 2- 600 μatm , 3 – 800 μatm , 4 – 1000 μatm , 5 – 1200 μatm , 6 – 2000 μatm , 7 – 3000 μatm). Group 6 and 7 are lacking from stage V analysis due to mortality levels.
