## Materials and methods

### 1. Protein preparation and trypsin digestion

Maize seeds were ground in liquid nitrogen and incubated in lysis buffer (Genecreate, Wuhan, China) (7 M of urea, 2 M of thiourea, 4% SDS, and 40 mM of Tris-HCl (pH 8.5)) containing 1 mM of PMSF and 2 mM of EDTA (final concentration) for 5 min; then, 10 mM of DTT (Sigma, Shanghai, China) (final concentration) was added to the sample. The suspension was sonicated for 10 min on ice and then centrifuged at 4 °C and 13,000 rpm for 20 min. The supernatant was mixed with 4 volumes of pre-cooled acetone at -20 °C for 2 h. After centrifugation, the protein pellets were air-dried and resuspended in 8 M of urea/100 mM of TEAB (Sigma, Shanghai, China). The protein samples were reduced with 10 mM of DTT at 56 °C for 30 min and then alkylated with 50 mM of iodoacetamide (IAM) (Sigma, Shanghai, China) at room temperature for 30 min in the dark. Next, 4 volumes of pre-cooled acetone were added at -20 °C for 2 h. After centrifugation, the protein pellets were air-dried and resuspended in 8 M of urea (Sigma, Shanghai, China) /100 mM of TEAB (pH 8.0). Then, the total protein concentration was measured using the Bradford method.

Trypsin (MS grade, Sigma, Shanghai, China) and 100 µg of protein from each sample were mixed at an enzyme–protein ratio of 1:50 (w/w). Digestion was performed at 37 °C for 16 h. After digestion, the peptides were desalted using C18 columns and dried with a vacuum concentrator.

### 2. LC–MS/MS analysis

The dried peptide sample was reconstituted with a 0.1% formic acid (FA) (HPLC grade, Sigma, Shanghai, China) aqueous solution and then centrifuged at 15,000 rpm for 10 min. Then, the sample solution was analyzed by HPLC–MS. The peptides were dissolved in mobile phase A (0.1% FA aqueous solution) and then separated using EASY-nLC 1200 ultra-high performance liquid system (Thermo Fisher Scientific, Waltham, MA, USA). The peptides were bound to the C18 capture column and the analytical column (Eksigent, San Francisco, CA, USA), then separated using a Q-Exactive HF (Thermo Fisher Scientific, Waltham, MA, USA) equipped with an EASY-Spray nanoliter electric spray ion source. Two mobile phases (A: 0.1% FA; B: 80% acetonitrile (ACN) (HPLC grade, Sigma, Shanghai, China), 0.1% FA) were used to establish analytical gradients over 60, 90, and 120 min. The flow rate of the liquid phase was set to 300 nL/min. After separation from the nanoliter liquid phase, the peptides were ionized by a nanoliter electric spray ion source, which could convert the ions from the solution into gas-phase ions. The gas-phase ions entered the Q-Exactive HF, and the exact mass of the parent ions and the information on the fragment ions were used to determine the peptide sequence.

### *3. UPLC Conditions and ESI-Q TRAP-MS/MS*

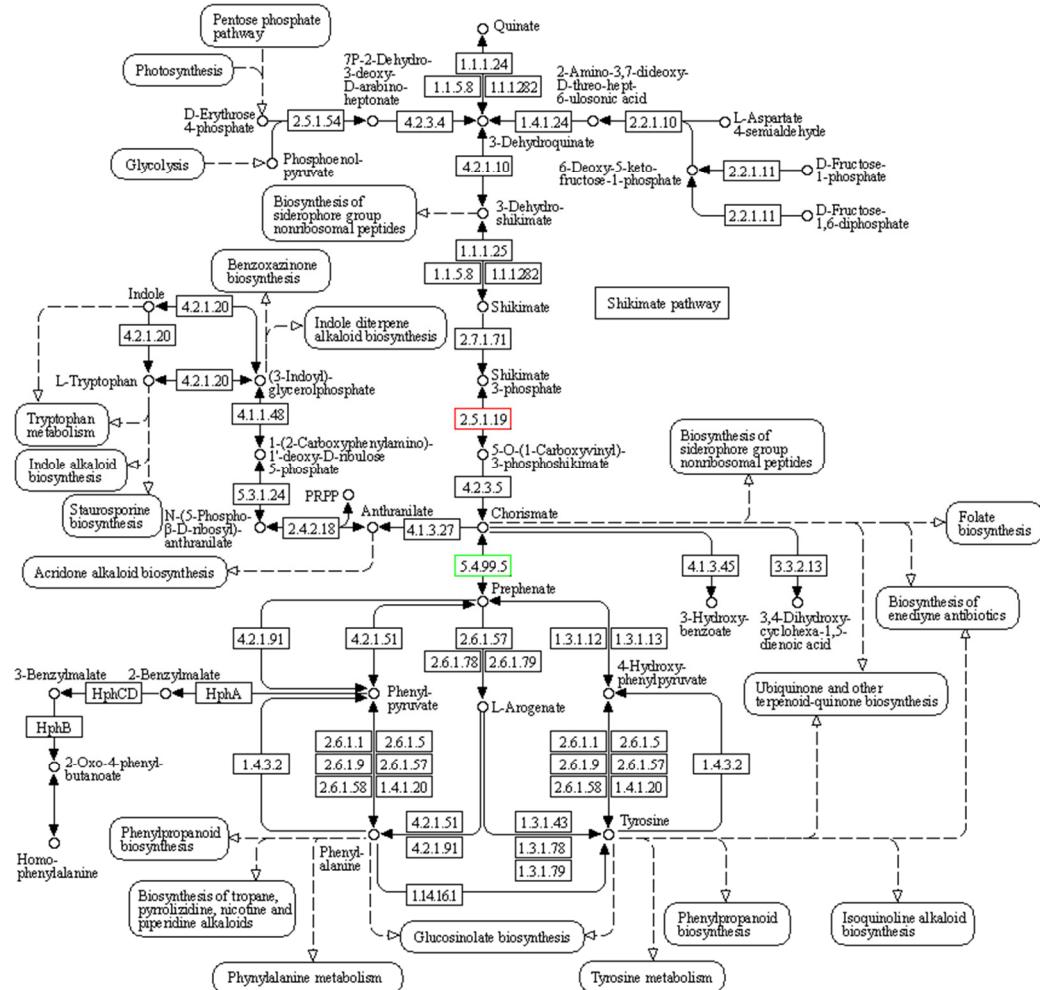

The extracted metabolites were analyzed using an UPLC-ESI-MS/MS system (UPLC, Shim-pack UFC SHIMADZU CBM30A system; MS, Applied Biosystems 4500 Q TRAP). The analytical conditions were as follows: UPLC: column, Agilent SB-C18 (1.8  $\mu$ m, 2.1 mm  $\times$  100 mm); mobile phase consisting of solvent A (98% DDH<sub>2</sub>O, 0.1% FA) and solvent B (ACN). Sample measurements were performed with a gradient program that employed the starting conditions of 95% A and 5% B. Within 9 min, a linear gradient to 5% A and 95% B was programmed, and a composition of 5% A and 95% B was maintained for 1 min. Subsequently, the composition was adjusted to 95% A and 5.0% B within 1.10 min and maintained for 2.9 min. The column oven was set to 40 °C, while the injection volume was 4  $\mu$ L. The effluent was alternatively connected to an ESI-triple quadrupole-linear ion trap (QTRAP)-M.

The ESI source operation parameters were as follows: ion source and turbo spray; source temperature of 550 °C; ion spray voltage (IS) of 5500 V (positive ion mode)/-4500 V (negative ion mode); ion source gas I (GSI), gas II (GSII), and curtain gas (CUR) set at 50, 60, and 30.0 psi, respectively; high collision gas (CAD). Instrument tuning and mass calibration were performed with 10 and 100  $\mu$ mol/L polypropylene glycol solutions in QQQ and LIT modes, respectively. QQQ scans were acquired as MRM experiments with the collision gas (nitrogen) set to 5 psi. The DP and CE for individual MRM transitions were carried out with further DP and CE optimization. A specific set of MRM transitions were monitored for each period according to the metabolites eluted within this period.

### *4. Data analysis*

MaxQuant 1.6.17.0 was used to retrieve and analyze the mass spectrometry data. Protein identification was performed against the UniProt *Zea mays* (maize) database supplemented with four foreign proteins, namely, EPSPS, Cry1Ab, Cry3Bb, and Cry1F.

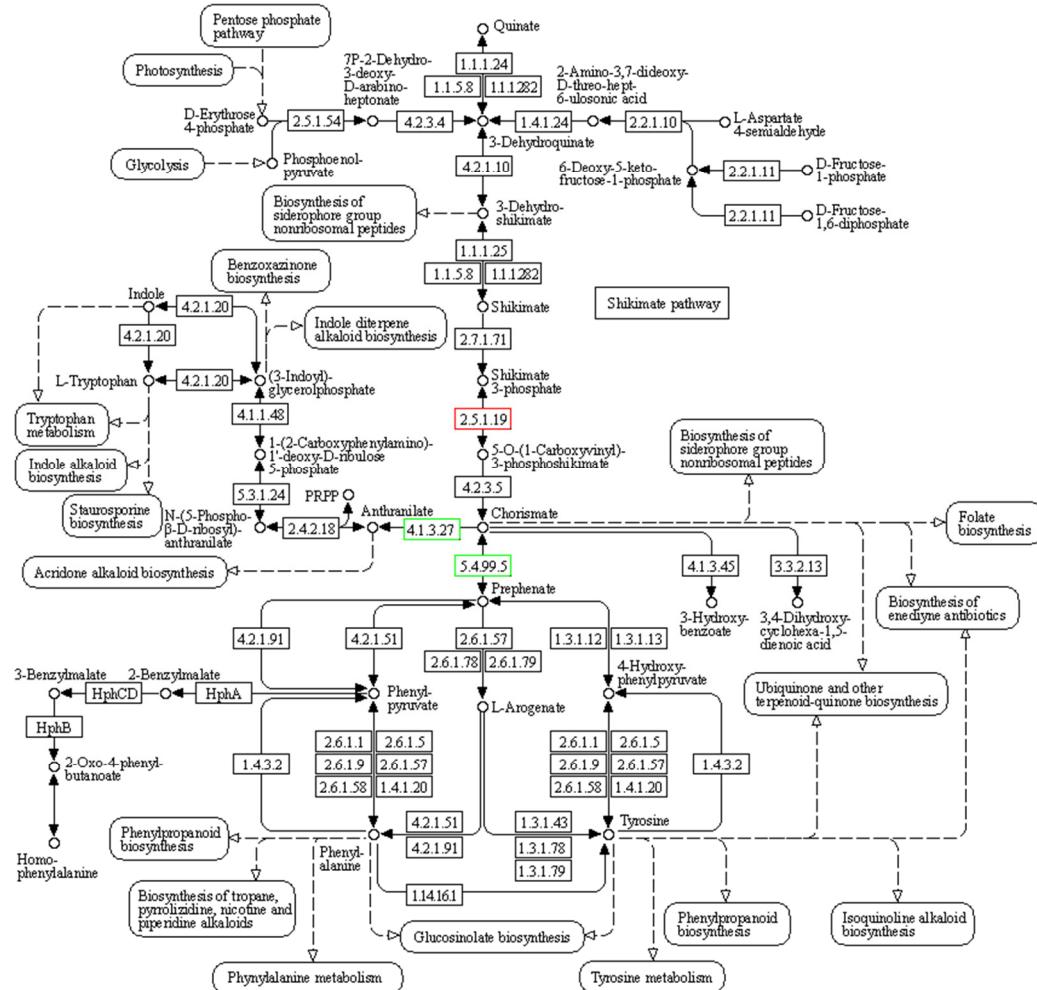

PHENYLALANINE, TYROSINE AND TRYPTOPHAN BIOSYNTHESIS
