Suppl. Tab.1. miRs found to be regulated 4.5-fold or more in microarray analysis (n = 6). Values are log(2)-transformed data, as calculated by the program Transcriptome Analysis Console (TAC). P values and FDR (false discovery rate-corrected) p values are given for each miR. Differential expression of miRs labelled in red was subsequently verified by qPCR analysis. *: p ≤ 0.05; **: p ≤ 0.01; ***: p ≤ 0.001.

Suppl. Tab. 2. $\dot{V}O_{2max}$ data (means and standard deviations) of all subjects included in qPCR analysis. The first six weeks of training (training #1) were completed by n=29 female participants, the second block (training #2) only by n=23, due to COVID19-associated restrictions. “HIIT-MICT” corresponds to subjects randomized to starting with HIIT (training #1) and then switching to MICT (training #2), “MICT-HIIT” to the group that completed the training sessions in reverse order.

Suppl. Fig.1 (previous pages). Changes in miR concentrations in skeletal muscle tissue in response to a single bout of exercise. (a) Comparison of microarray and qPCR data (n=6). (b) Changes in miR concentrations as assessed by qPCR in all participants (n=29). (c) Fold changes as detected by microarray (n=6), qPCR (n=6), and qPCR (n=29). Subjects of the MICT-HIIT group are labelled with circles, those of the HIIT-MICT group with triangles.
