

## SUPPLEMENTAL FIGURES

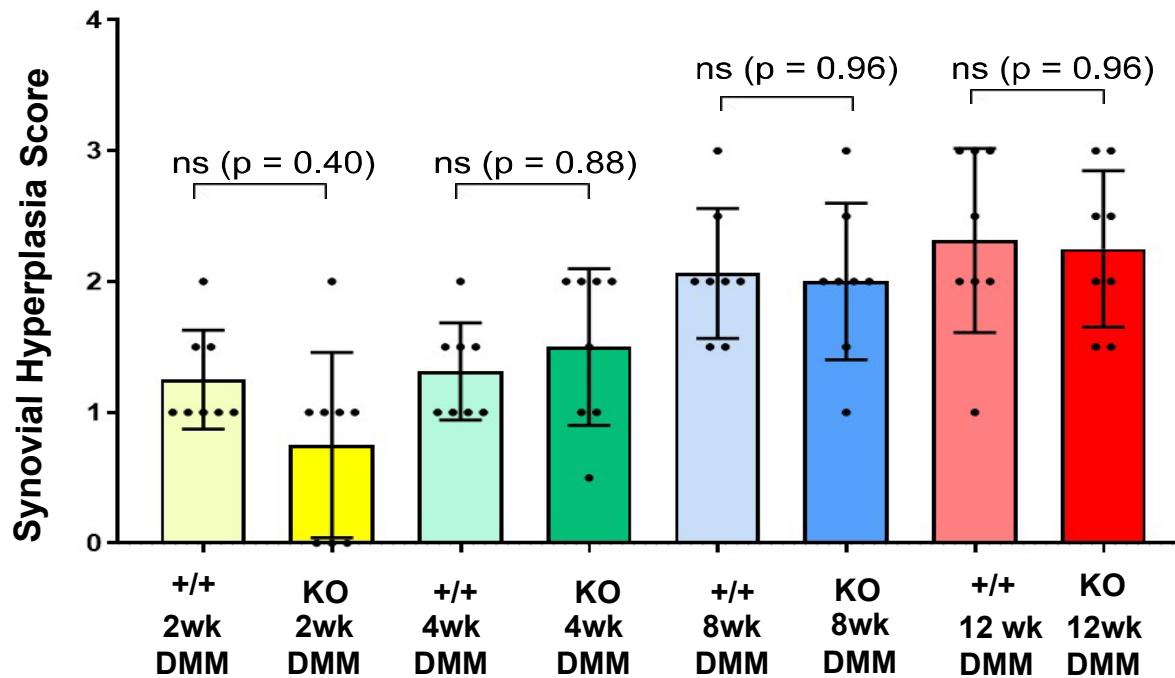

**Supplemental Figure S1**

**Supplemental Figure S1. Protein levels of CCR2 and GFP in the articular cartilage (AC) of *CCR2-Col1αKO* and *CCR2<sup>+/+</sup>* mice following Tamoxifen injection.** Paraffin embedded knee joint sections are immunostained for GFP and CCR2, two weeks after the first Tam injection. Positive staining is detected as brown precipitate (red arrows). GFP staining is not detected in any of the genotypes. Conversely, CCR2 staining is detected in the AC cells of both *CCR2<sup>+/+</sup>* and *CCR2-Col1αKO* mice. Images are representative of 6 different mice for each of the experimental groups described, ranging between 14 and 18 weeks of age. Scale bars are 100  $\mu\text{m}$ .

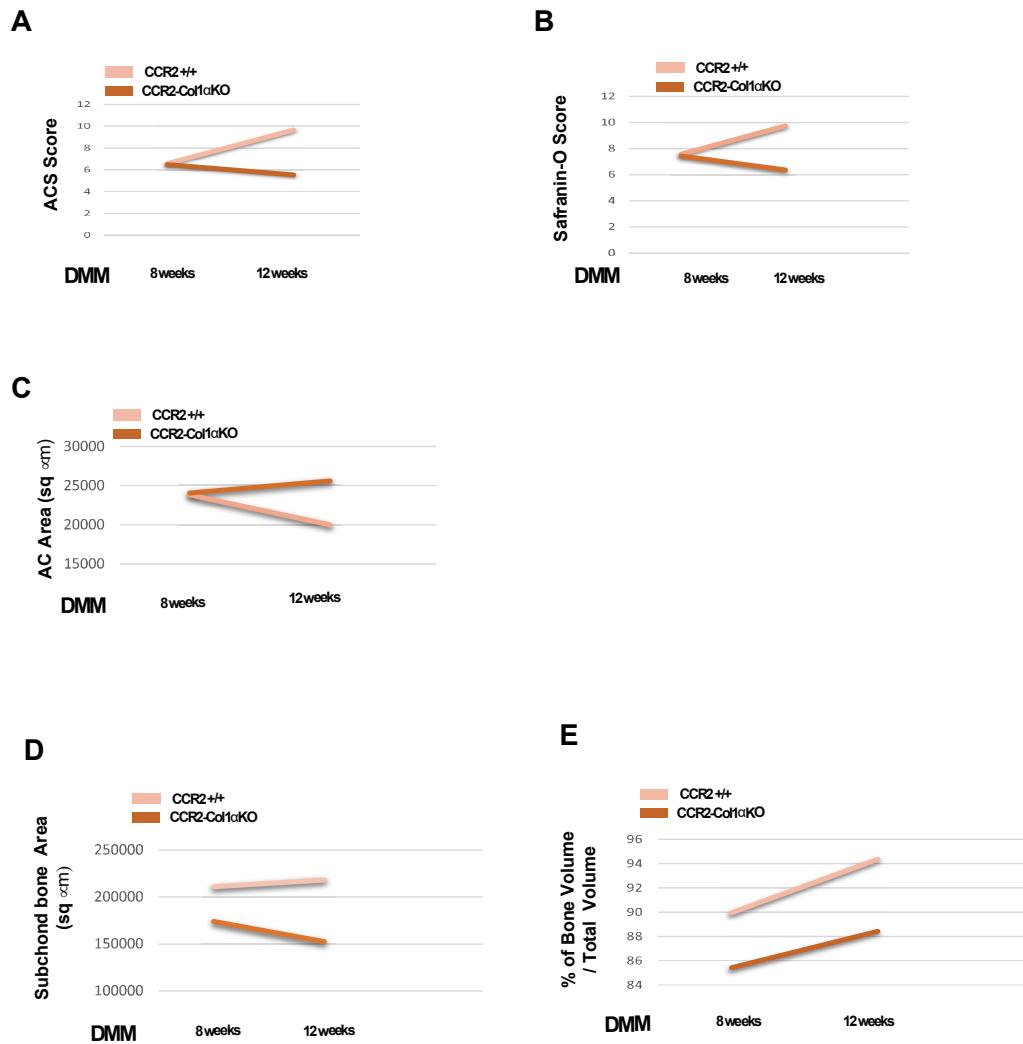

**Supplemental Figure S2.** PTOA assessment in mouse knee joints of *CCR2-Col1αKO* and *CCR2<sup>+/+</sup>* within each genotype, following early *Ccr2* inactivation. ACS, Saf-O score, Histomorphometric analysis of cartilage quantification, Subchondral bone thickness and percentabte of bone volume / Total Volume (BV/TV) were assessed at the time point indicated following early *Ccr2* inactivation (before DMM). N=8 mice for each experimental point. Within each genotype (*CCR2<sup>+/+</sup>*, light orange; *CCR2-Col1αKO*, dark orange), group analyses were performed with ordinary one-way ANOVA, followed by Tukey's post-hoc test for multiple comparisons, available in the **Supplemental Table S1**.

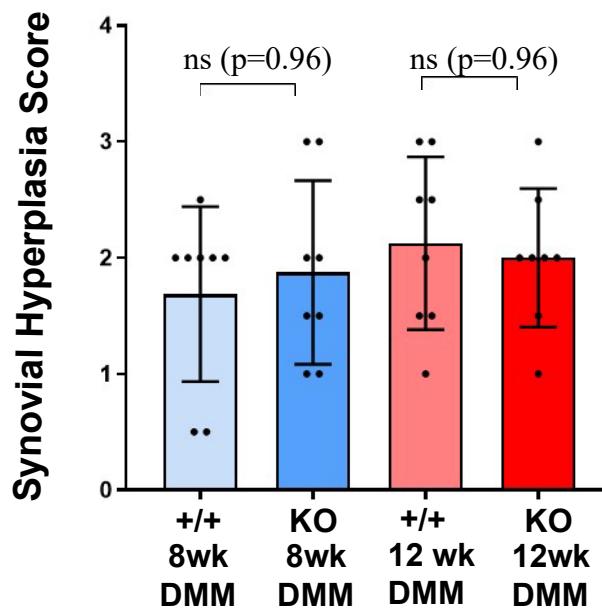

**Supplemental Figure S3**

**Supplemental Figure S3.** Synovial hyperplasia assessment in mouse knee joints of *CCR2-Col1αKO* and *CCR2+/-*, following early *CCR2* inactivation. Synovial hyperplasia scores (scale 0-3) of *CCR2-Col1αKO* and *CCR2+/-* mouse knees at the time point indicated.  $N=8$  mice for each experimental point. The graphs represent the mean  $\pm$  standard deviation; indicated  $P$ -values were determined by Wilcoxon rank sum tests at each time point, following adjustment for multiple comparisons.

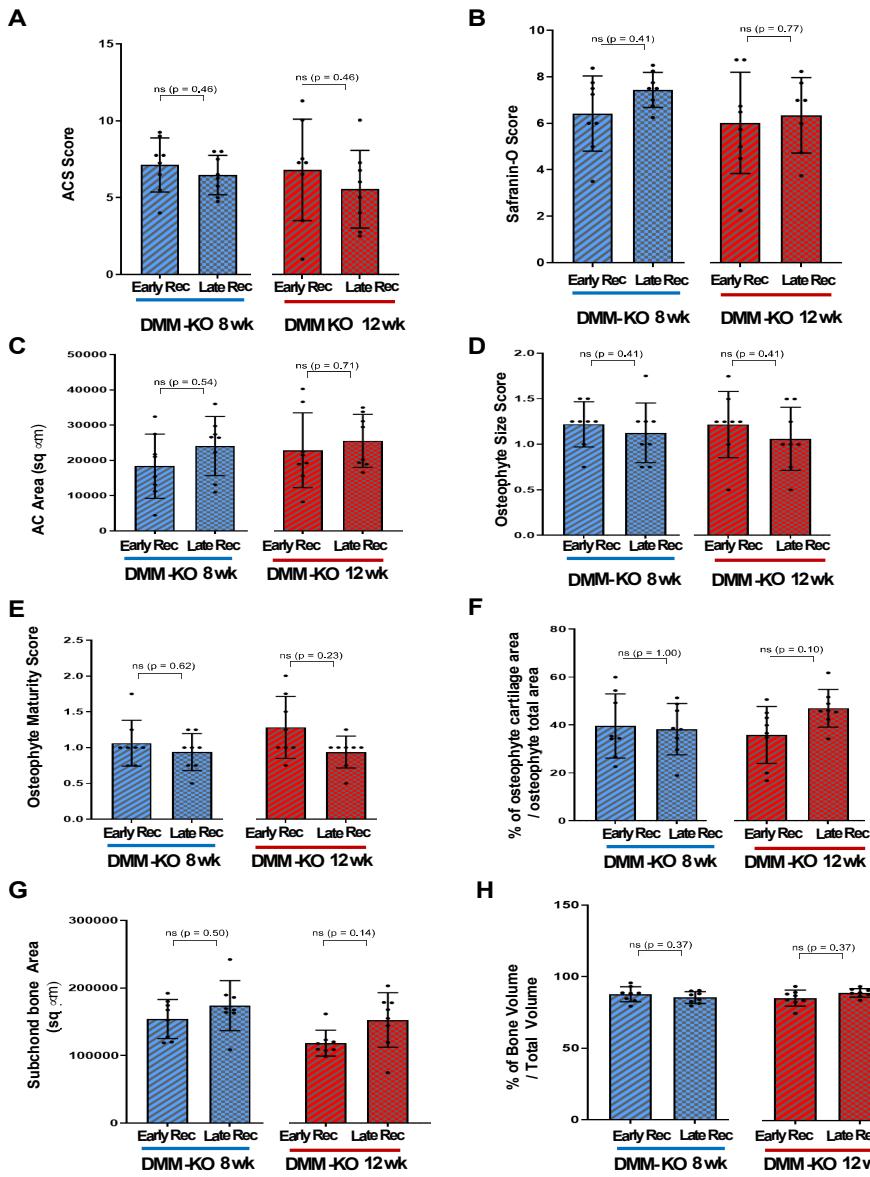

Supplemental Figure S4

**Supplemental Figure S4.** PTOA assessment in mouse knee joints of *CCR2-Col1αKO* and *CCR2<sup>+/+</sup>* within each genotype, following late *Ccr2* inactivation. ACS, Saf-O score, Histomorphometric analysis of cartilage quantification, Subchondral bone thickness and percentabe of bone volume / Total Volume (BV/TV) were assessed at the time point indicated following late *Ccr2* inactivation (at 4 weeks after DMM). N=8 mice for each experimental point. Within each genotype (*CCR2<sup>+/+</sup>*, light orange; *CCR2-Col1αKO*, dark orange), group analyses were performed with Welch's t-test, available in the [Supplemental Table S3](#).

**Supplemental Figure S5**

**Supplemental Figure S5. Synovial hyperplasia assessment in mouse knee joints of *CCR2-Col1αKO* and *CCR2+/-*, following late *CCR2* inactivation.** Synovial hyperplasia scores (scale 0-3) of *CCR2-Col1αKO* and *CCR2+/-* mouse knees at the time point indicated. N=8 mice for each experimental point. The graphs represent the mean  $\pm$  standard deviation; indicated p-values were determined by Wilcoxon rank sum tests at each time point, following adjustment for multiple comparisons.

**Supplemental Figure S6**

**Supplemental Figure S6. PTOA assessment in mouse knee joints of *CCR2-Col1αKO* comparing early vs late *Ccr2* ablation.** ACS, Saf-O score, Histomorphometric analysis of cartilage quantification, Osteophyte Size, Osteophyte maturity, Oateophyte cartilage quantification, Subchondral bone thickness and percentabe of bone volume / Total Volume (BV/TV) were compared at 8 and 12 weeks after DMM. N=8 mice for each experimental point. The graphs represents the mean  $\pm$  standard deviation; indicated p-values were determined by Wilcoxon rank sum tests at each time point, following adjustment for multiple comparisons, available in the Supplemental Table S7.

**Supplemental Table S1.** PTOA assessment in mouse knee joints of *CCR2-Col1αKO* and

*CCR2+/+* within each genotype, following early *Ccr2* inactivation.

Within each genotype (*CCR2+/+* or *CCR2-Col1αKO*, group analyses were performed with ordinary one-way ANOVA, followed by Tukey's post-hoc test for multiple comparisons.

**Supplemental Table S2.** Effect of early CCR2 inactivation (before DMM) on synovial hyperplasia in mouse CCR2-Col1 $\alpha$ KO and CCR2+/+ knee joints (N=8).

OA Parameters		Week 2				Week 4			
		Z (p-value)	Mean Score (Rank Sums)	median	mean (SD)	Z (p-value)	Mean Score (Rank Sums)	median	mean (SD)
<i>Synovial Hyperplasia</i>	DMM CCR2+/+	1.63(0.40)	10.31	1	1.25(0.38)	-0.77 [0.88]	7.56	1.25	1.31(0.37)
	DMM CCR2-AggKO		6.69	1	0.75(0.71)		9.44	1.75	1.50(0.60)

OA Parameters		Week 8				Week 12			
		Z (p-value)	Mean Score (Rank Sums)	median	mean (SD)	Z (p-value)	Mean Score (Rank Sums)	median	mean (SD)
<i>Synovial Hyperplasia</i>	DMM CCR2+/+	0.06(0.96)	8.63	2	2.06(0.50)	0.27(0.96)	8.88	2.25	2.31(0.70)
	DMM CCR2-AggKO		8.38	2	2.00(0.60)		8.13	2.25	2.25(0.60)

Data presented show median, mean and standard deviation (SD), for each group at separate time points (2, 4, 8 and 12 weeks post-surgery). Indicated z- and P-values were determined by Wilcoxon rank sum tests between DMM CCR2+/+ and DMM CCR2-Col1 $\alpha$ KO groups separately at each time point, following adjustment for multiple comparison (Benjamini-Hochberg).

**Supplemental Table S3.** PTOA assessment in mouse knee joints of *CCR2-Col1αKO* and *CCR2+/+* within each genotype, following late Ccr2 inactivation.

OA Parameter Late Recomb.	Groups	Mean Diff.	95.00% CI of diff.	P -value
<i>ACS</i>	DMM 8w CCR2 +/+ vs. DMM 12w CCR2 +/+	-3.09	-5.45, -0.74	<b>0.001</b>

	Late Recombination		7.88	1.75	1.88(0.79)		7.63	2	2.00(0.60)

Data presented show median, mean and standard deviation (SD), for each group at separate time points (8 and 12 weeks post-surgery). Indicated z- and P-values were determined by Wilcoxon rank sum tests between DMM CCR2+/+ and DMM CCR2-Col1 $\alpha$ KO groups separately at each time point, following adjustment for multiple comparison (Benjamini-Hochberg).
