

Figure S1. Fold-change (FC) of leaves and roots secondary metabolites biosynthesis and degradation in Micro-Tom tomato plants after 11 days of UV (11d) or 3 days after the end of the UV exposure (rec), in respect to control plants. FC values were elaborated by the Omics Viewer Dashboard of the PlantCyc Pathway Tool software. Data for each biochemical pathway represent the sum of Log₂FC of each detected compound. Syn, biosynthesis; Deg, degradation.
