Supplementary Figure S4. Proposed model of the signaling pathway leading to stilbene biosynthesis induction and VaMyb40 and VaMyb60 functions in this process in the grapevine cells. Ultraviolet (UV), elicitors, pathogen effectors, and other environmental cues are perceived by specific receptors. Recognition of an external signal leads to sustained calcium influx, activation of calcium sensors, MAPK cascades, which promotes plant hormone signaling and transcription factors (TF) activation including VaMyb40 and VaMyb60. TF activate transcription of the genes responsible for stilbene biosynthesis. CDPK – calcium-dependent protein kinases; CML – calmodulin-like proteins; MAPK – mitogen activated protein kinases; TF - transcription factors.
