Supplementary Materials and methods

1. Determination of Eight Grain Morphology Traits

The 29 barley accessions used in this study included nine wild accessions from the Near East Fertile Crescent (Wb-NE), ten wild accessions from Tibetan Plateau (Wb-T) and ten cultivated accessions from China (Wb-C) (Figure S1), which were provided by the United States Department of Agriculture (USDA) and the Huazhong Agricultural University barley germplasm collection (See Table S2 for details). Eight grain morphological traits (grain area, grain perimeter, grain length, grain width, length-width ratio, roundness of grain, density factor and grain diameter) were measured by using a camera-assisted phenotyping system (SC-G, Wanshen Detection Technology Co., Ltd., Hangzhou, China) (Yin et al 2015). SPSS 24.0 software was used for one way ANOVA analysis of all measured traits in the three groups.

2. ABBA-BABA Analysis and Treemix analysis

The VCF file containing 165,848 high-quality SNPs was used to perform ABBA-BABA analysis using the software Dsuite (0.4 version) with “Dtrios” command (Malinsky et al 2020). The ABBA-BABA statistics (D statistics) were applied to biallelic SNPs across four groups or taxa: P1, P2, P3, and O based on the rooted tree (((P1,P2),P3),O) (Malinsky et al 2020). According to the results of rooted neighbor-joining tree (Figure 1C), HS18 (a wild barley accession from the Near East Fertile Crescent) was selected as outgroup because it occupied the “O” position in the rooted tree (((P1,P2),P3),O). *H. bulbosum* was not used as an outgroup because after adding *H. bulbosum*, many SNPs were not biallelic but triallelic, which violated the requirements of ABBA-BABA test. The treemix1.13 was used to test mixture events of the three groups based on the 165,848 high quality SNPs.

3. PCA and Population Structure Inference based on SNPs of All Accessions

The 153 barley accessions (29 RNA-sequencing and 124 re-sequencing) were used to infer the genetic relationship of barley groups. These accessions were assigned into four groups: Wb-NE (13 accessions), Cb-NE (cultivated barley from the Near East Fertile Crescent, six accessions), Wb-T (20 accessions) and Cb-C (114 accessions representing landraces from China, specially from Tibet). The 78,861 SNPs common identified in both the VCF files of the 29 RNA-sequencing accessions and the 124 re-sequencing accessions were used to perform PCA and population structure inference. PCA and population structure inference were performed by plink (1.90b6.18 version) (Purcell et al 2007) and ADMIXTURE (1.23 version) (Alexander et al 2009), respectively. Nucleotide diversity (π) of four groups was analyzed using VCFtools v0.1.16 (Danecek et al 2011).

4. Selective Sweep Analysis and Identification of Selective Genes

The 114,120 high-quality SNPs randomly distributed on chromosomes were used for the selective sweep analysis for two of the three pure groups (25 accessions) by measuring F_{st} in each 15-kb genomic fragment with a step of 5 kb along all chromosomes. Genomic regions under selective sweeps were measured by the sliding windowed F_{st} using VCFtools v0.1.16 (Danecek et al 2011). The windows with the top 5% F_{st} value were considered as putative selection regions. The selective genes were considered to be in the windows with the top 5% F_{st} values (0.4314 in Wb-NE vs Wb-T and 0.7205 in Wb-T vs Cb-C), and were annotated by KEGG database.

5. Extraction and Detection of Untargeted Metabolites

Untargeted metabolites were extracted from the 25 accessions, with 3 replicates per accession. Analyses were performed using an UHPLC (1290 Infinity LC, Agilent Technologies) coupled to a quadrupole time-of-flight (AB Sciex TripleTOF 6600). For HILIC separation, samples were analyzed using a 2.1 mm \times 100 mm ACQUITY UPLC BEH 1.7 μ m column (waters, Ireland). In both ESI positive and negative modes, the mobile phase contained A = 25 mM ammonium acetate and 25 mM ammonium hydroxide in water, and B = acetonitrile. The gradient was 85% B for one min and was linearly reduced to 65% in 11 min, and then was reduced to 40% in 0.1 min and kept for four min, and then increased to 85% in 0.1 min, with a five min re-equilibration period employed. The ESI source conditions were set as follows: Ion Source Gas1 (Gas1) as 60, Ion Source Gas2 (Gas2) as 60, curtain gas (CUR) as 30, source temperature: 600°C, IonSpray Voltage Floating (ISVF) \pm 5500 V. In MS only acquisition, the instrument was set to acquire over the m/z range of 60-1000 Da, and the accumulation time for TOF MS scan was set at 0.20 s/spectra. In auto MS/MS acquisition, the instrument was set to acquire over the m/z range of 25-1000 Da, and the accumulation time for product ion scan was set at 0.05 s/spectra. The product ion scan was acquired using information dependent acquisition (IDA) with high sensitivity mode selected. The collision energy (CE) was fixed at 35 V with \pm 15 eV. Declustering potential (DP) was set as \pm 60V.

After detection, AB Sciex TripleTOF 6600 was used to collect the primary and secondary spectra. The raw data was converted into mzXML format by Proteowizard, and then peak alignment, retention time correction and peak area extraction were performed by XCMS program. The structure of metabolites was identified by accurate mass number matching (< 25 ppm) and secondary spectrum matching. For each metabolite, the area of mass spectrum peak was calculated and corrected for preliminary quantification. After that, we searched the self-built database (with standard products) for annotating the metabolites.
