

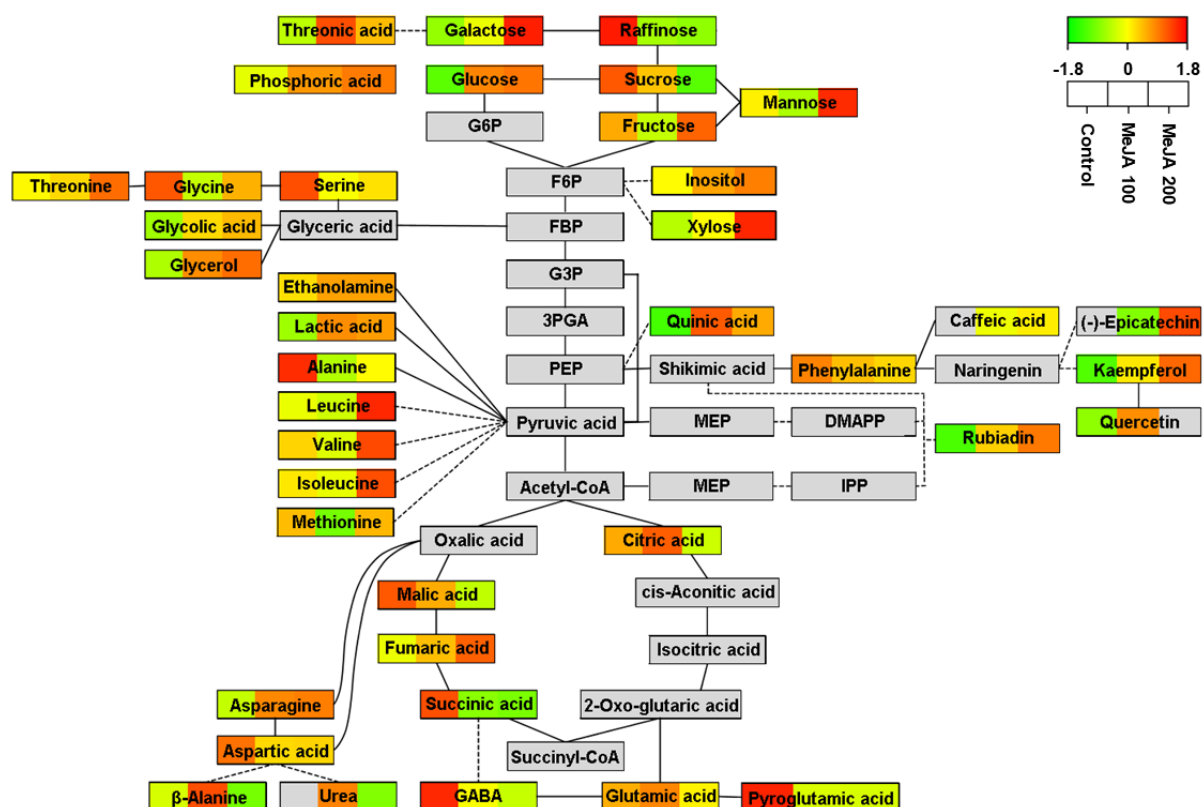

**Figure S1.** The influence of variables in projection plots displaying contributed metabolites to construct partial least squares (PLS) 1 (A) and 2 (B) from partial least squares discriminant analysis (PLS-DA) results obtained from leaves and calli treated with different methyl jasmonate (MeJA) concentrations

**Figure S2.** Metabolic pathways of *D. major* calli treated with various methyl jasmonate (MeJA) concentrations. Metabolite differences are visualized as the scaling factor ranges from -1.8 to 1.8. A scaling value above zero represents higher than average levels in each value of the control, MeJA 100  $\mu$ M-treated calli, and MeJA 200  $\mu$ M-treated calli, and is colored by the red color intensity. A scaling value below zero represents lower than the average levels and is indicated by green color intensity. Gray color represents not detected metabolites.
