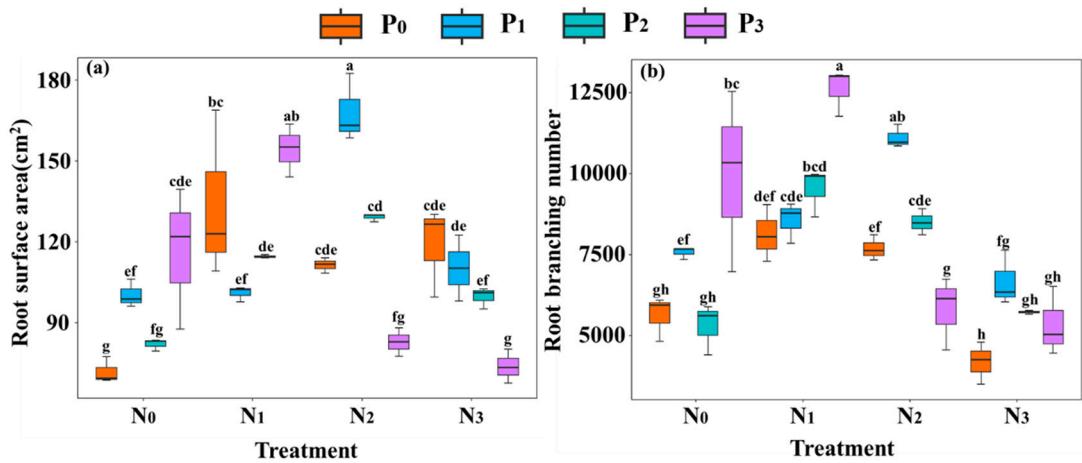

Figure S1. Effect of nitrogen and phosphorus addition on root traits of *Castanopsis kawakamii* seedlings

Notes: (a), (b) represent root branching number, root surface area, respectively. N_iP_i: single phosphorus addition treatment, N_iP₀: single nitrogen addition treatment, N₁P_i: low nitrogen and phosphorus interaction treatment, N₂P_i: medium nitrogen and phosphorus interaction treatment, N₃P_i: high nitrogen and phosphorus interaction treatment, where i=1,2,3. The differences represented by different lowercase letters between treatments with different nitrogen and phosphorus concentrations added are significant ($p<0.05$). The same applies to the following.

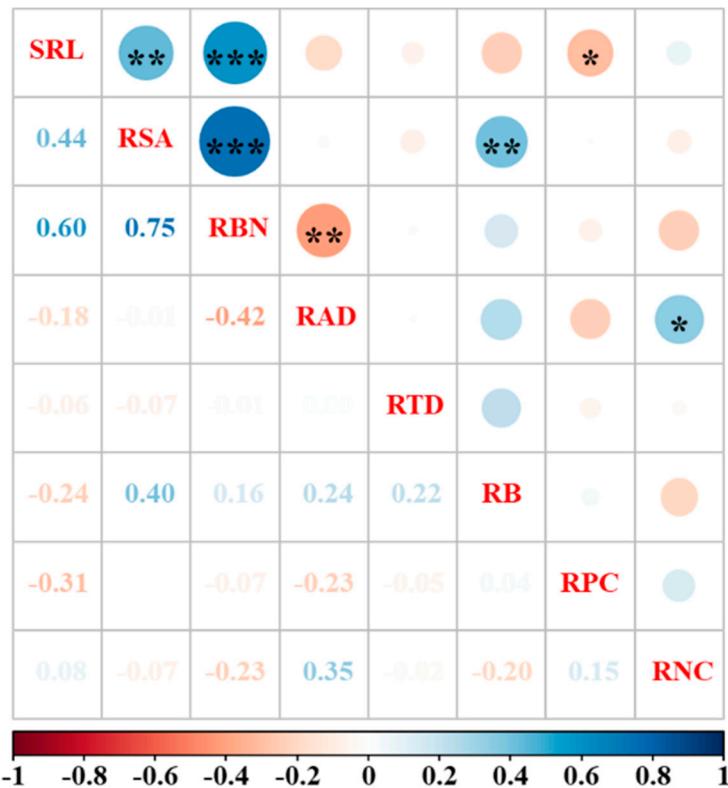

Figure S2. Correlation between root traits of *Castanopsis kawakamii* seedlings

Note: In the figure, SRL, RSA, RBN, RAD, RTD, RB, RPC, and RNC represent specific root length, root surface area, root branching number, root average diameter, root tissue density, root biomass, phosphorus content, and nitrogen content of the roots, respectively. The same applies to the following. In the figure, * denotes a significant correlation at the 0.05 level, ** denotes a highly significant correlation at the 0.01 level, and *** denotes a highly significant correlation at the 0.001 level.

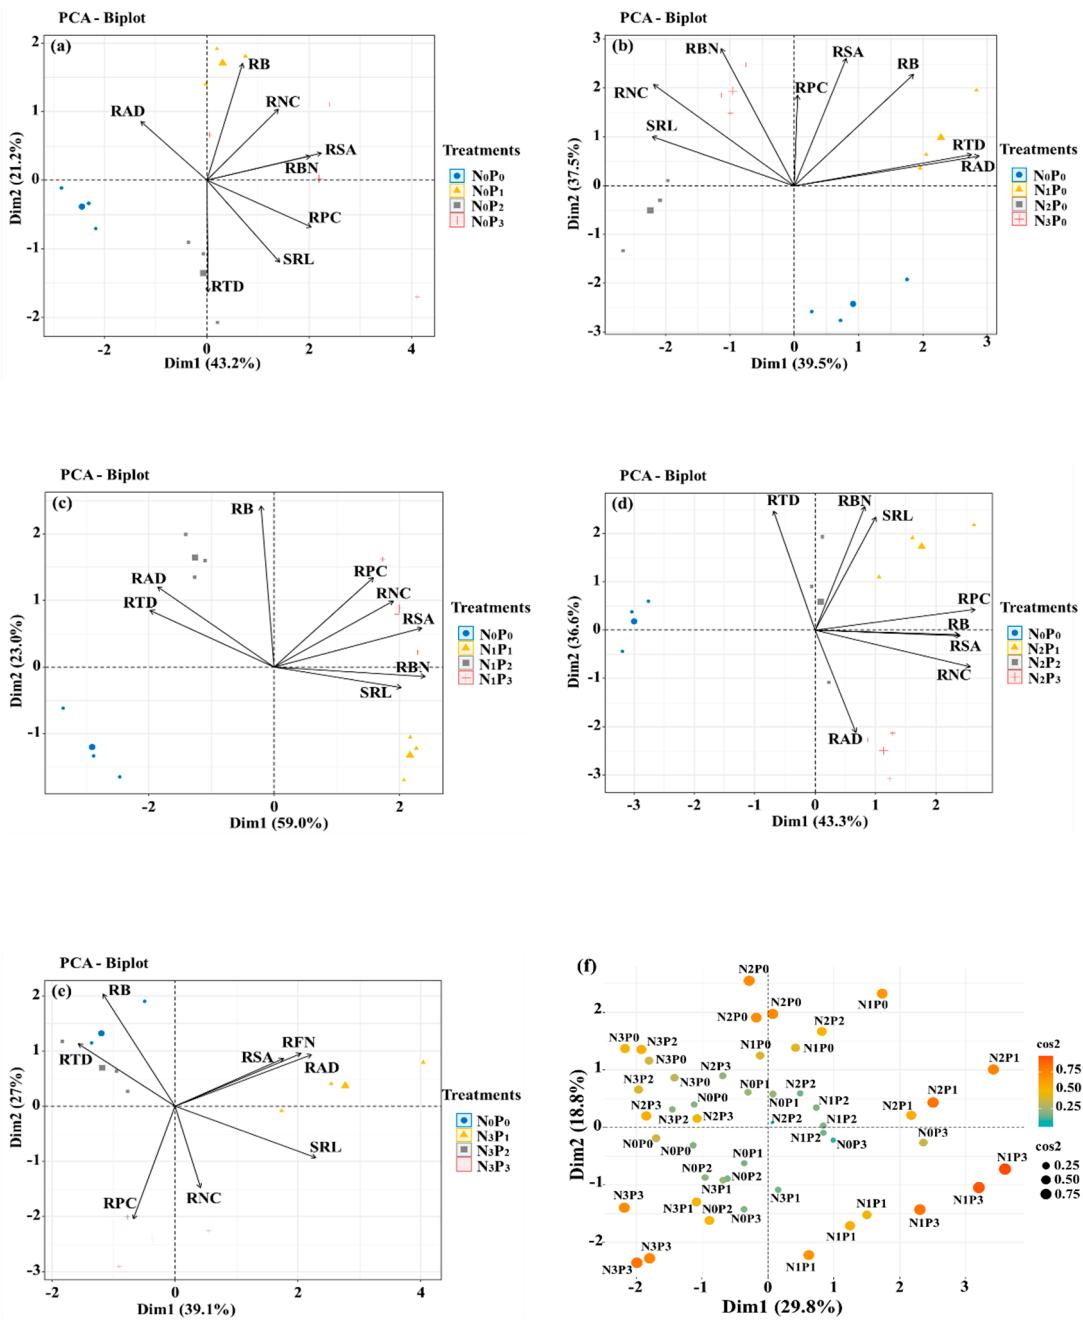

Figure S3. Principal component analysis (PCA) of root traits under different nitrogen and phosphorus addition treatments.

Note: N0P0 is a non-nitrogen phosphorus addition treatment, (a): Single phosphorus addition treatment (N0Pi); (b): Single nitrogen addition treatment (NiP0); (c): Low nitrogen and phosphorus interactive addition treatment (N1Pi); (d): Interactive addition of medium nitrogen and phosphorus(N2Pi); (e): High nitrogen and phosphorus interactive addition treatment (N3Pi), where, i=1, 2, 3; (f): Scatter contribution plot of

different nitrogen and phosphorus addition treatments. The cos2 value represents the contribution of the variable to the principal component.
