
Supplementary file S1

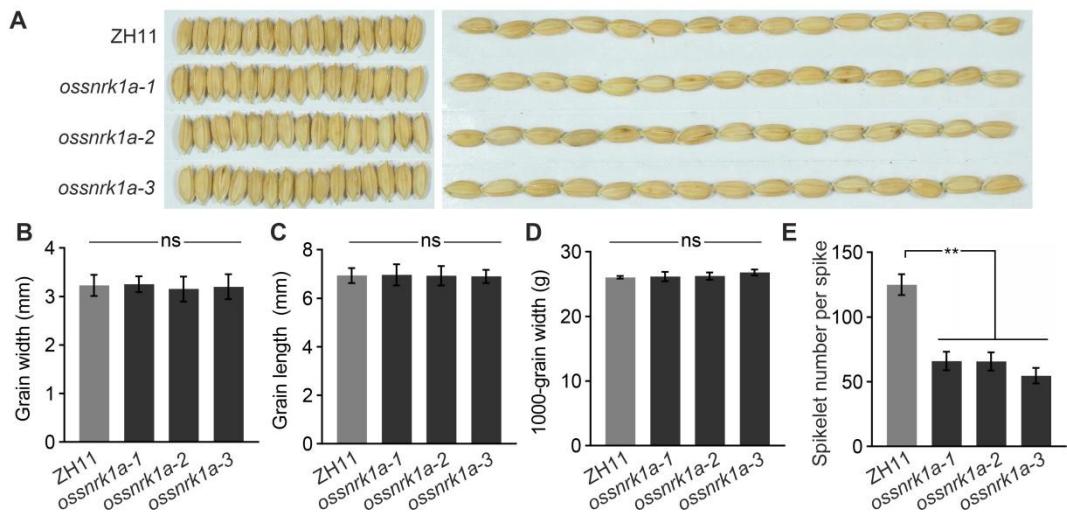

Figure S1. The *ossnrk1a* mutants displayed no obvious defects in grain size and weight, compared with the wild type. **(A)** Morphology of mature grains from ZH11 and the *ossnrk1a* mutants. **(B)** and **(C)** Measurement of grain width, and grain length of ZH11 and *ossnrk1a* mutant seeds, respectively. with bars representing mean values \pm SD ($n = 15$). **(D)** 1000-grain weight of ZH11 and *ossnrk1a* mutants with bars representing means \pm SD ($n = 3$). **(E)** The spikelet number per spike of ZH11 and *ossnrk1a* mutants with bars representing means \pm SD. “ns” means no significance by Student’s *t*-test.

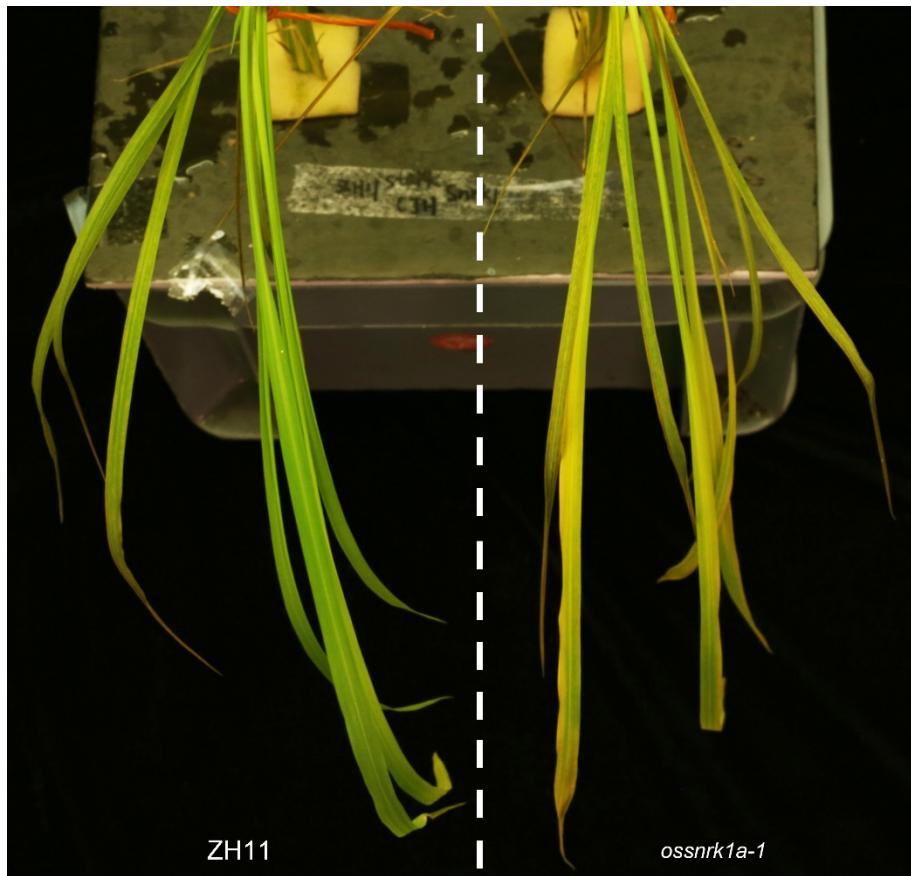

Figure S2. Phenotypes of ZH11 and *ossnrk1a-1* under starvation/continuously dark stresses. After 4-day continuously dark treatment, the water-culturing ZH11 (left) and *ossnrk1a-1* (right) plants were imaged.

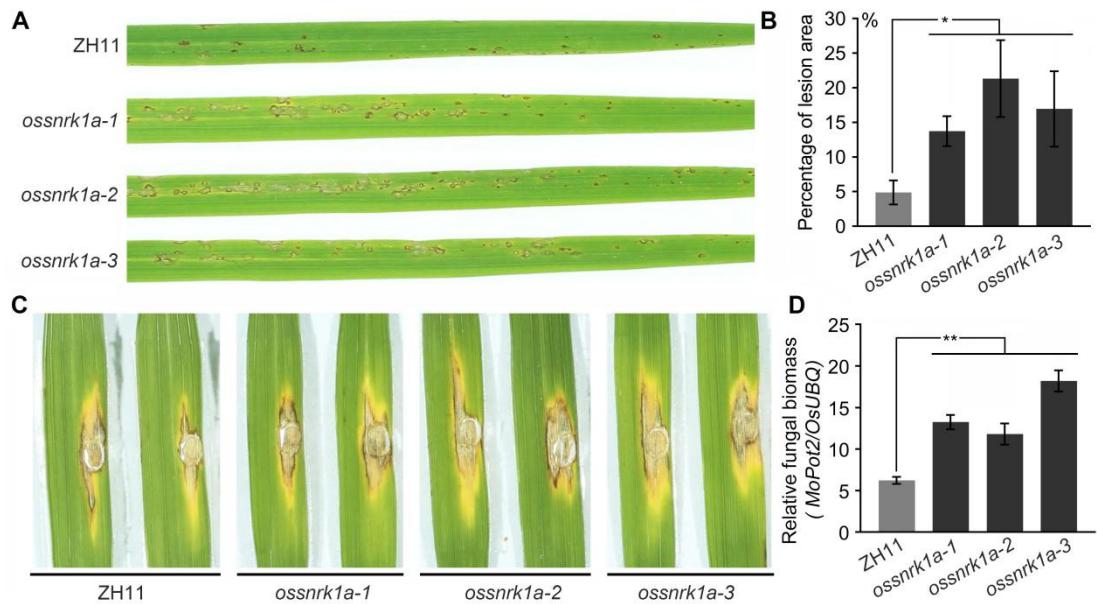

Figure S3. The *ossnrk1a* mutants showed more susceptibility to *M. oryzae* infection. **(A)** and **(B)** Spraying inoculation on 3-week-old ZH11 and *ossnrk1a* mutants seedlings with Guy11 conidia. The leaves of *ossnrk1a* mutants at 5 dpi displayed larger diseased lesion area, compared to those of ZH11. **(C)** Five-week-old plants of ZH11 and *ossnrk1a* mutants were subjected to punch inoculation with Guy11 conidia. The diseased leaves were photographed at 9 dpi. **(D)** Fungal biomass of the punch-inoculation leaves was measured by qPCR analysis ($MoPot2/OsUBQ$) with extracted genomic DNA as templates. Bars in **(B)** and **(D)** are means \pm SD from three biological replicates. Significant differences were determined by Student's *t*-test (*, $p < 0.05$ and **, $p < 0.01$).

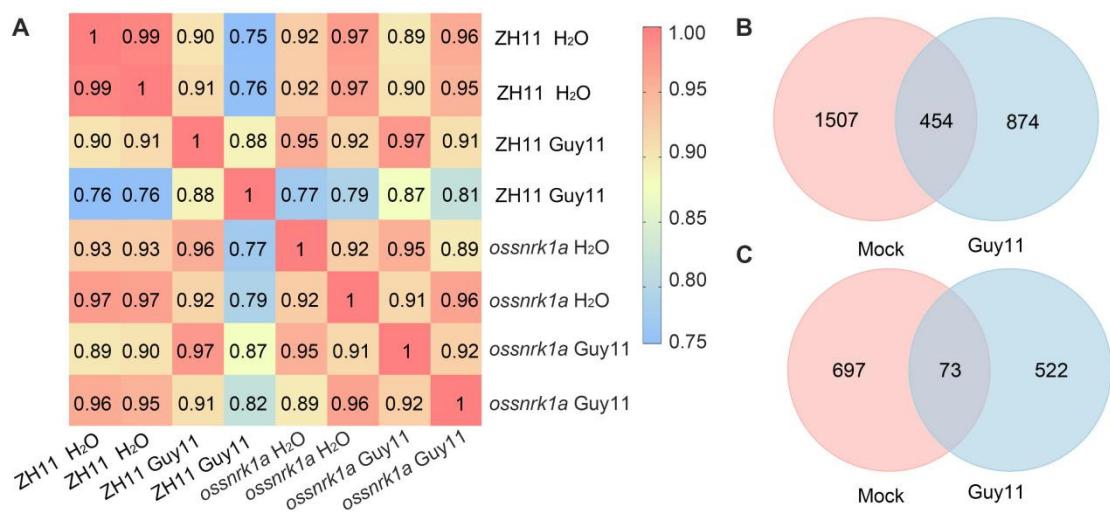

Figure S4. Correlation analysis of the transcriptome replicates and venn plots of the DEGs in *ossnrk1a-1* and ZH11. **(A)** Correlation analysis using Pearson correlation coefficient indicating high correlation coefficients of the biological replicates for each sample in RNA-seq. **(B)** and **(C)** are the venn diagrams indicating the upregulated (B) and downregulated (C) DEGs numbers from *ossnrk1a-1* vs. ZH11 with non-pathogen (pink pie) and Guy11 infection treatments (blue pie), respectively.

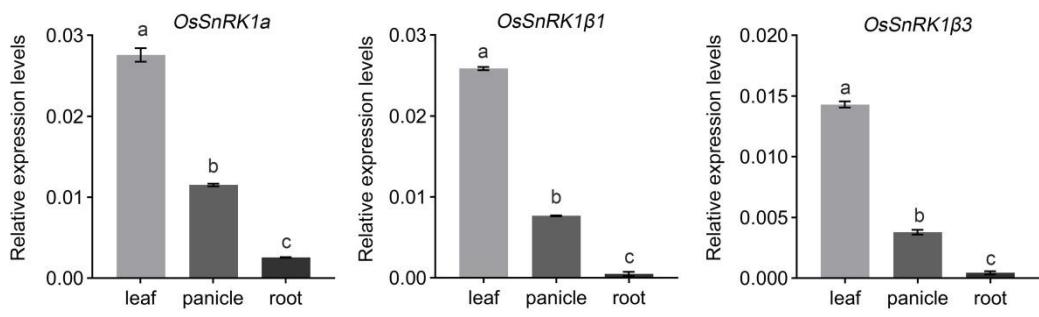

Figure S5. Transcript levels of *OsSnRK1 α* , *OsSnRK1 β 1* and *OsSnRK1 β 3* in leaf, young panicle and root tissues of ZH11 at heading stage. Data are means \pm SD (n = 3). Statistically significant differences were indicated by Mann-Whitney test (Different letters mean significant difference among treatments ($p < 0.05$)).

Table S1. List of primer pairs used in this study.
