1. Montecarlo experiments

This Supplement provides tables and graphs to give further numerical evidence to the discussions in the main paper.

1.1. Asymptotic distribution of $\hat{\gamma}$

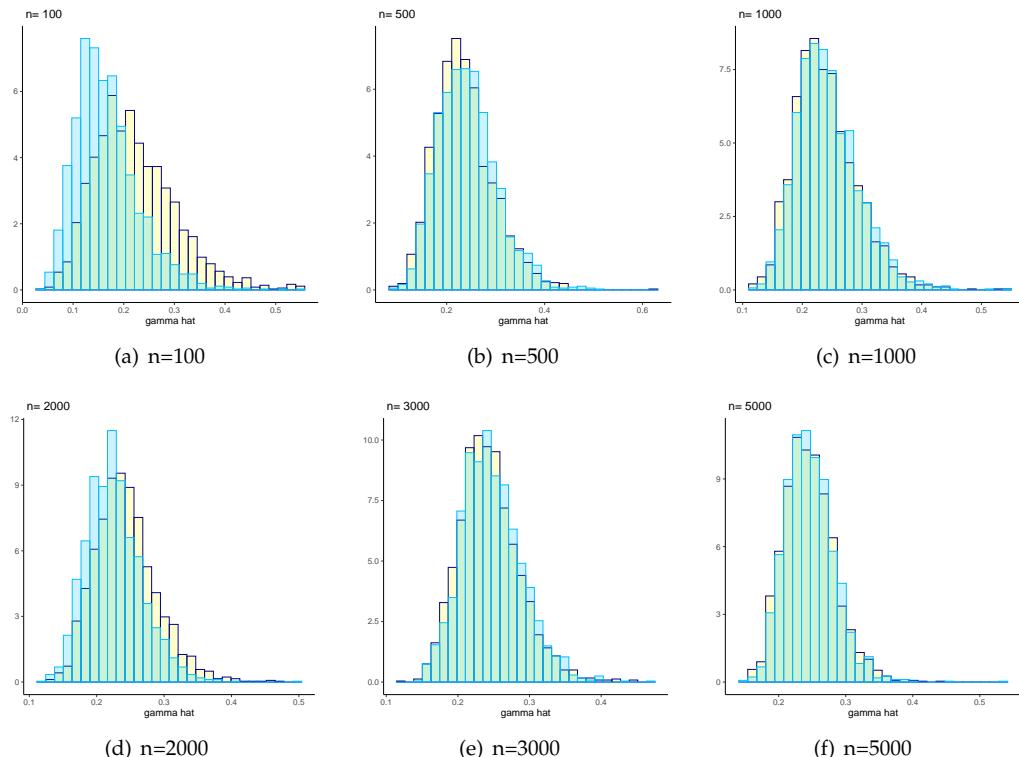

Figure 1. Histograms of the empirical distribution of $\hat{\gamma}_k$ for selected sample sizes; $k = n^{0.5}$; data samples are generated from a Pareto(4) distribution. Yellow: values obtained by Montecarlo simulations (2000 iterations); blue: values obtained by Algorithm 1 (2000 iterations). The value of γ used has been selected randomly from a pool of estimated values.

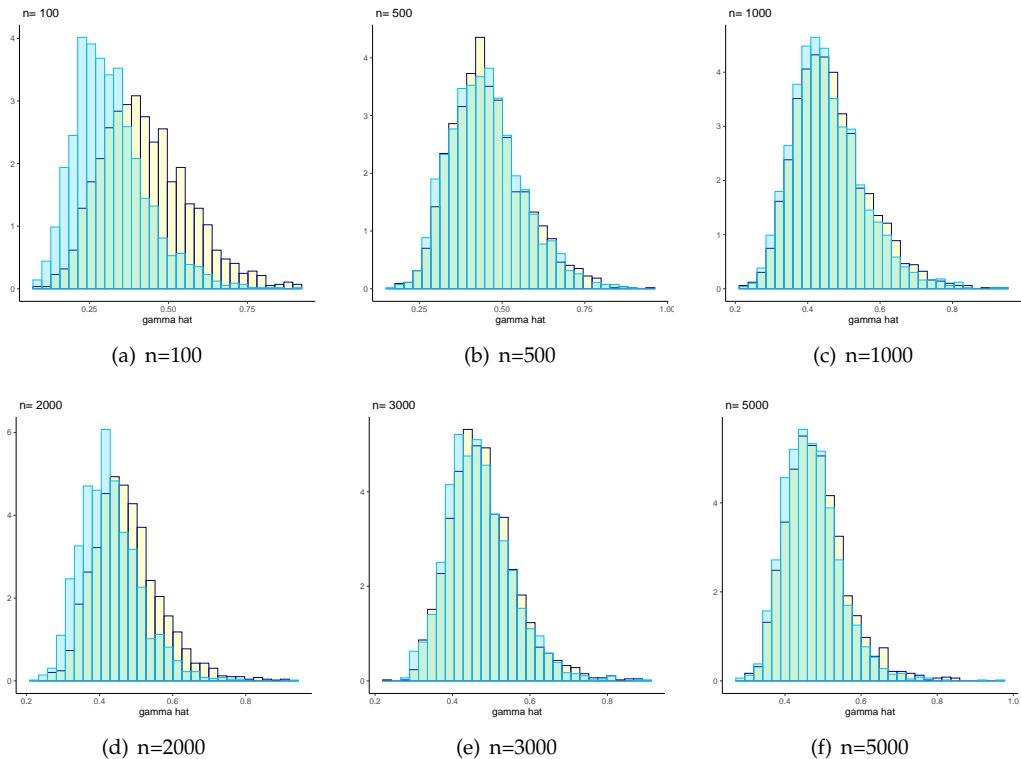

Figure 2. Histograms of the empirical distribution of $\hat{\gamma}_k$ for selected sample sizes; $k = n^{0.5}$; data samples are generated from a Burr(2) distribution. Yellow: values obtained by Montecarlo simulations (2000 iterations); blue: values obtained by Algorithm 1 (2000 iterations). The value of γ used has been selected randomly from a pool of estimated values.

5 1.2. Estimation of $\hat{\gamma}$

Tables 1 to 13 report further evidence on the performance of the estimators of γ for different distributions. Refer to the main paper for a detailed description of the Montecarlo experiments, notation, distributions and alternative estimation strategies used.
