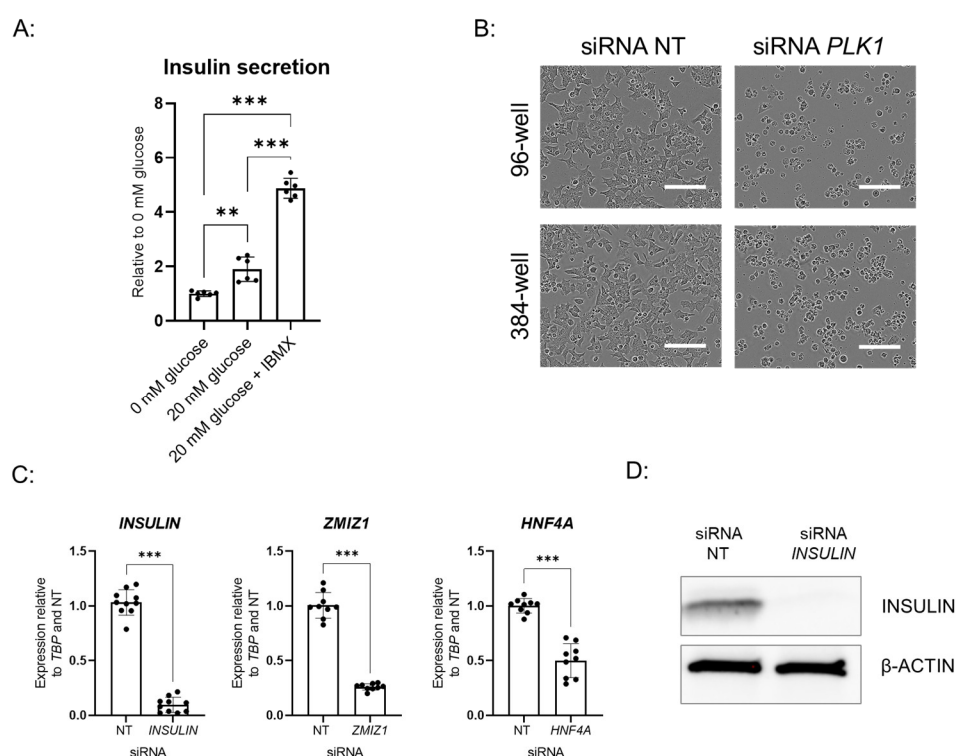

Figure S1. Establishment of siRNA knockdown and GSIS assay in EndoC- β H1 cells. **(A)** Glucose stimulated insulin secretion (GSIS) assay in EndoC- β H1 cells cultured in a 96-well format. Data points are the mean \pm SD $n = 6$ for each condition. ** p value < 0.01 , *** p value < 0.001 , one-way ANOVA. **(B)** Representative images of cells after *PLK1* and non-targeting control (NT) siRNA knockdown in EndoC- β H1 cells cultured in 96-well and 384-well format. Scale bar 100 μ m. **(C)** Relative expression of *INSULIN*, *ZMIZ1* and *HNF4A* after siRNA knockdown in a 96-well format. Data points are the mean \pm SD $n = 9$ of independent wells from three experiments. *** p value < 0.001 , t -test. **(D)** Western blot analysis of *INSULIN* and β -ACTIN after NT and *INSULIN* siRNA knockdown.

Figure S2: siRNA high-throughput screen in EndoC- β H1 cells with a GSIS readout. **(A)** Details of the siRNA high-throughput screen with a plate map example showing positions of controls (different colours) and randomized siRNAs positions for each replicate (n = 3) of text mining genes (candidate gene 1-3, G1-G3). **(B)** Insulin secretion data for non-targeting controls (siRNA NT) for Plates 2-7 in three conditions (0 mM glucose, 20 mM glucose, 20 mM glucose + IBMX). Box plots show min max of n = 33 for siNT. **p value < 0.01, ***p value < 0.001 by one-way ANOVA. **(C)** Dot plot of β -values for secreted insulin corresponding to controls on each plate. Each dot represents the β -value from a different assay plate (Plate 1 - Plate 7) in three conditions (0 mM glucose, 20 mM glucose, 20 mM glucose + IBMX).

Figure S3. Insulin secretion (β -value) for the hits selected for validation. Dot plot depicting β -value for secreted insulin after knockdown of *GHSR*, *HSPA5* and *ATF4* in three GSIS conditions during the screen. Black dotted lines show selected β -value cut-offs of ≥ 1.5 and ≤ -1.5 .
