

SUPPLEMENTARY MATERIALS

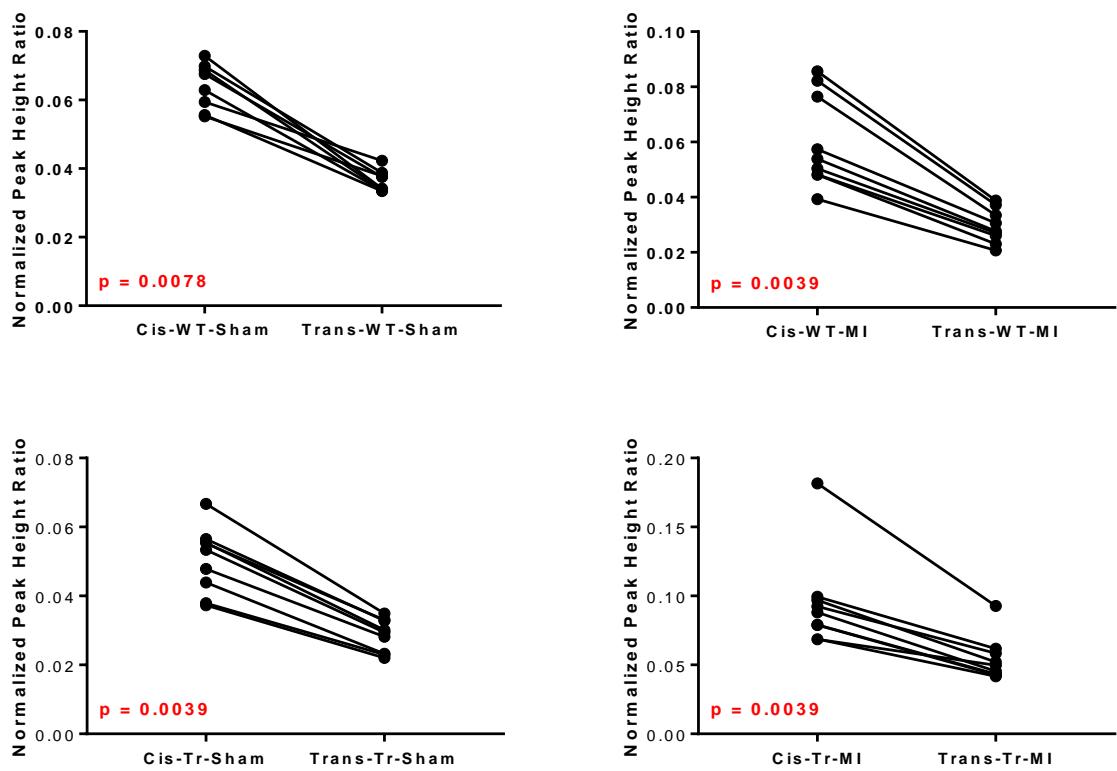

Supplementary Figure 1. Correlation of each regioisomer of *trans*-EET and total *trans*-EETs in erythrocyte membrane and cardiac tissue of WT mice.

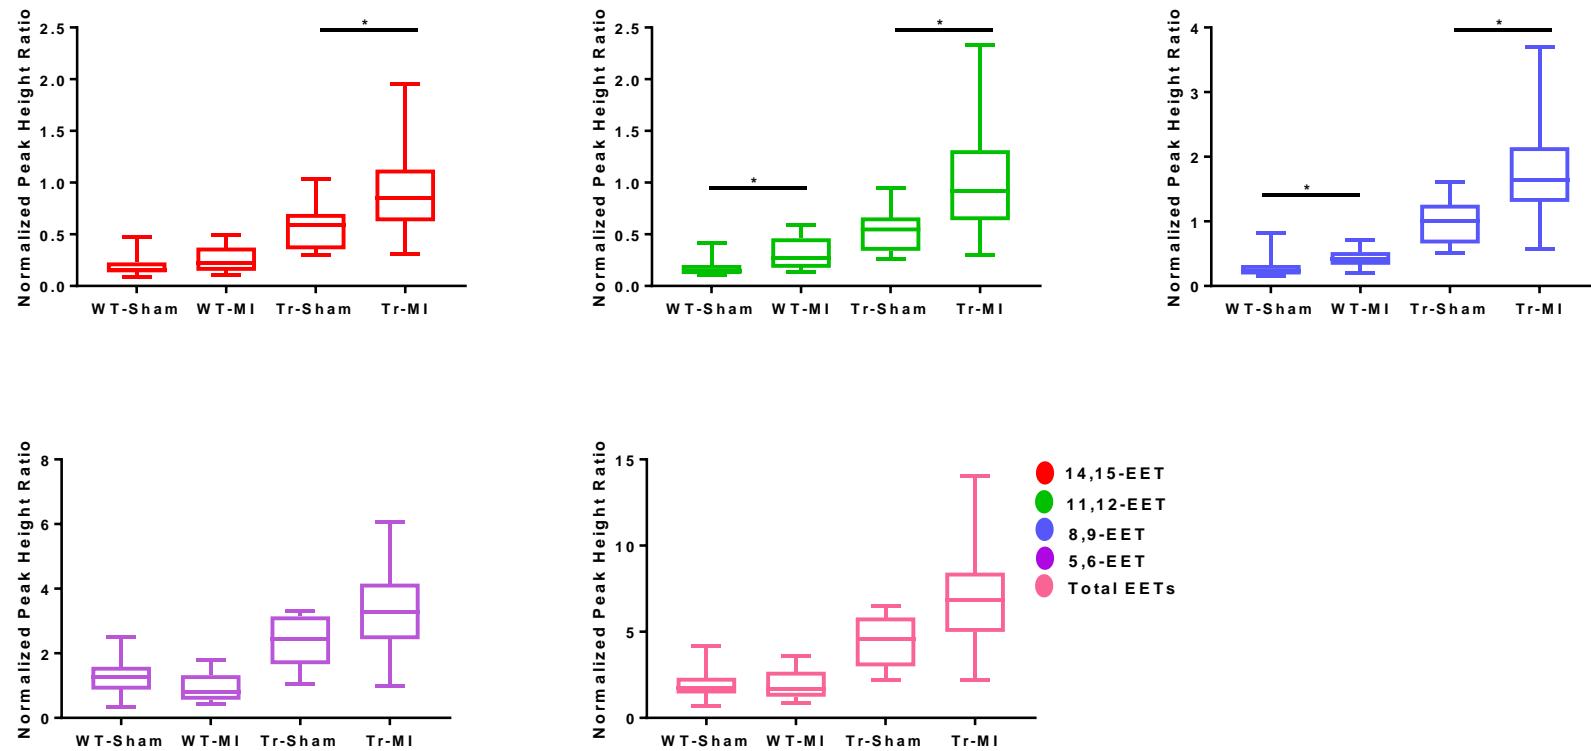

Supplementary Figure 2. Correlation of each regioisomer of *trans*-EET and total *trans*-EETs in erythrocyte membrane and cardiac tissue of Tr mice.

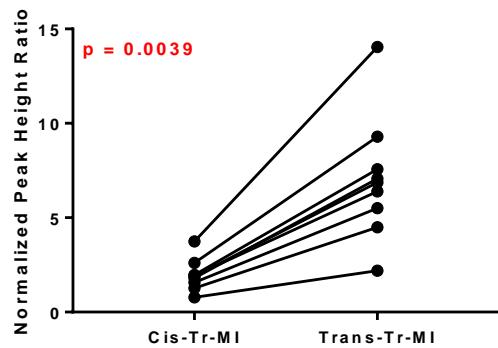

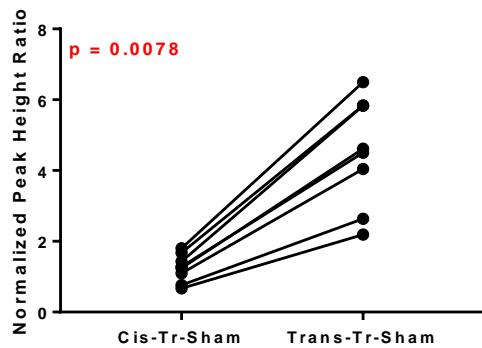

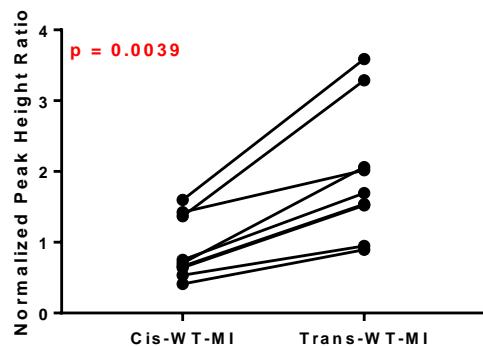

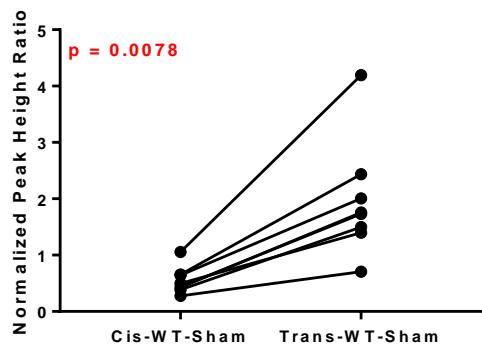

Supplementary Figure 3. Levels of each regioisomer of *trans*-EETs and total *trans*-EET extracted from erythrocyte membrane of WT and Tr mice subjected to sham or MI surgery. * indicates $p \leq 0.05$, ** indicates $p \leq 0.01$, and **** indicates $p \leq 0.0001$.

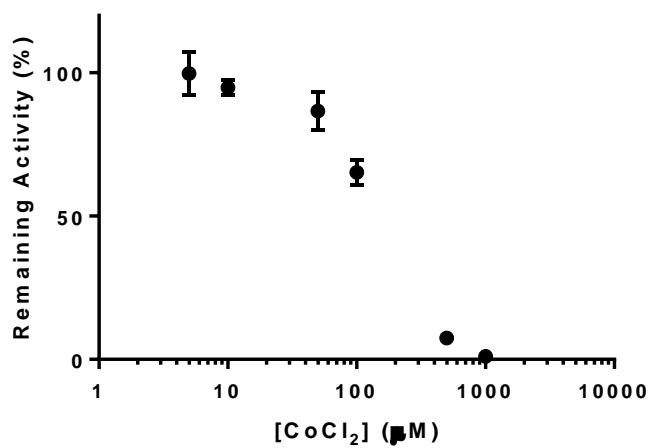

Supplementary Figure 4. Comparison between total *cis*- and *trans*-EETs levels extracted from erythrocyte membrane of WT and Tr mice.

Supplementary Figure 5. Levels of each regioisomer of *trans*-EETs and total *trans*-EETs extracted from cardiac tissue of WT and Tr mice subjected to sham or MI surgery. * indicates $p \leq 0.05$.

Supplementary Figure 6. Comparison between total *cis*- and *trans*-EETs levels extracted from cardiac tissue of WT and Tr mice.

Supplementary Figure 7. CYP2J2 activity in human adult ventricular myocytes measured using terfenadine as a probe substrate in the presence of varying concentration of CoCl₂. Each point is the average of triplicates, and error bars represent the standard deviation of replicates. Activity begins to drop in the presence of 50 μM CoCl₂ (15% drop in activity), with greater loss in activity at higher concentrations.
