

## **Supplementary Material**

### *Description of Matlab Script*

The input variables in the Matlab script (page 2) are the viscosity ratio (“n”), the viscosity of the more viscous fluid (“miu\_MV”) and the volume of each solution (“VMV\_t” and “VLV\_t”). The output variables are the mass of glycerol (“mMV\_g”) and water (“mMV\_2w”) to prepare the more viscous fluid; the mass of glycerol (“mLV\_g”), water (“mLV\_w”) and CaCl<sub>2</sub>·2H<sub>2</sub>O (“mMV\_Cacl2”) to prepare the less viscous fluid. The units of mass are kg. If the output variables are 0 for all parameters, it means that it is not possible to prepare aqueous solutions of glycerol for the pre-defined rheological and physical properties. This solution occurs when  $x_{\text{CaCl}_2\cdot 2\text{H}_2\text{O}} < 0$ ,  $x_{\text{CaCl}_2\cdot 2\text{H}_2\text{O}} > 1$ ,  $x_{0,\text{glycerol}} < 0$ ,  $x_{0,\text{glycerol}} > 1$ ,  $x_{\text{MV},\text{glycerol}} < 0$  or  $x_{\text{MV},\text{glycerol}} > 1$ , where  $x_{\text{MV},\text{glycerol}}$  is the mass fraction of glycerol in the more viscous fluid. This Matlab algorithm also estimates the density and the viscosity of each fluid and the respective refractive index at  $\theta = 293.15$  K.

Each step is explaining the Matlab script, and the following list summarizes this calculation:

0. The user defines the viscosity ratio (“n”), the viscosity of the more viscous fluid (“miu\_MV”) and the volume of each solution (“VMV\_t” and “VLV\_t”);
1. Estimation of the viscosity of the less viscous fluid (“miu\_LV”) from viscosity ratio (“n”);
2. Calculation of the mass fraction of glycerol in the more viscous (MV) fluid from Equation 11;
3. Calculation of the water density in MV fluid from Equation 6;
4. Calculation of the glycerol density in MV fluid from Equation 6;
5. Calculation of the variable Q and κ from Equation 5 and 4;
6. Calculation of the glycerol volume fraction in MV fluid from Equation 7;
7. Calculation of the MV fluid density from Equation 3;
8. Calculation of the MV fluid refractive index from Equation 12, considering  $RI_{\text{water}} = 1.325$  and  $RI_{\text{glycerol}} = 1.470$ ;
9. Define that refractive indices of MV and less viscous (LV) fluids are the same;
10. Solve an equation system using Equations 10, 12, 14 and 18;
11. Calculation of the mass of glycerol and water required to prepare the MV fluid;
12. Calculation of the mass of glycerol, water and calcium chloride required to prepare the LV fluid;
13. If the output variables are ≠0 for all parameters, it means that it is possible to prepare aqueous solutions of glycerol for the pre-defined rheological and physical properties.
